Mathurin et al., Hepatology 2000; 32:1008-1017; Paik et al., Hepatology 2003; 37:1043-1055; Balagopal et al., Gastroenterology 2008; 135:226-233..

START liver fibrosis study

- Sub-study of 230 (4577) patients
- Baseline FibroScan, FIB-4, APRI

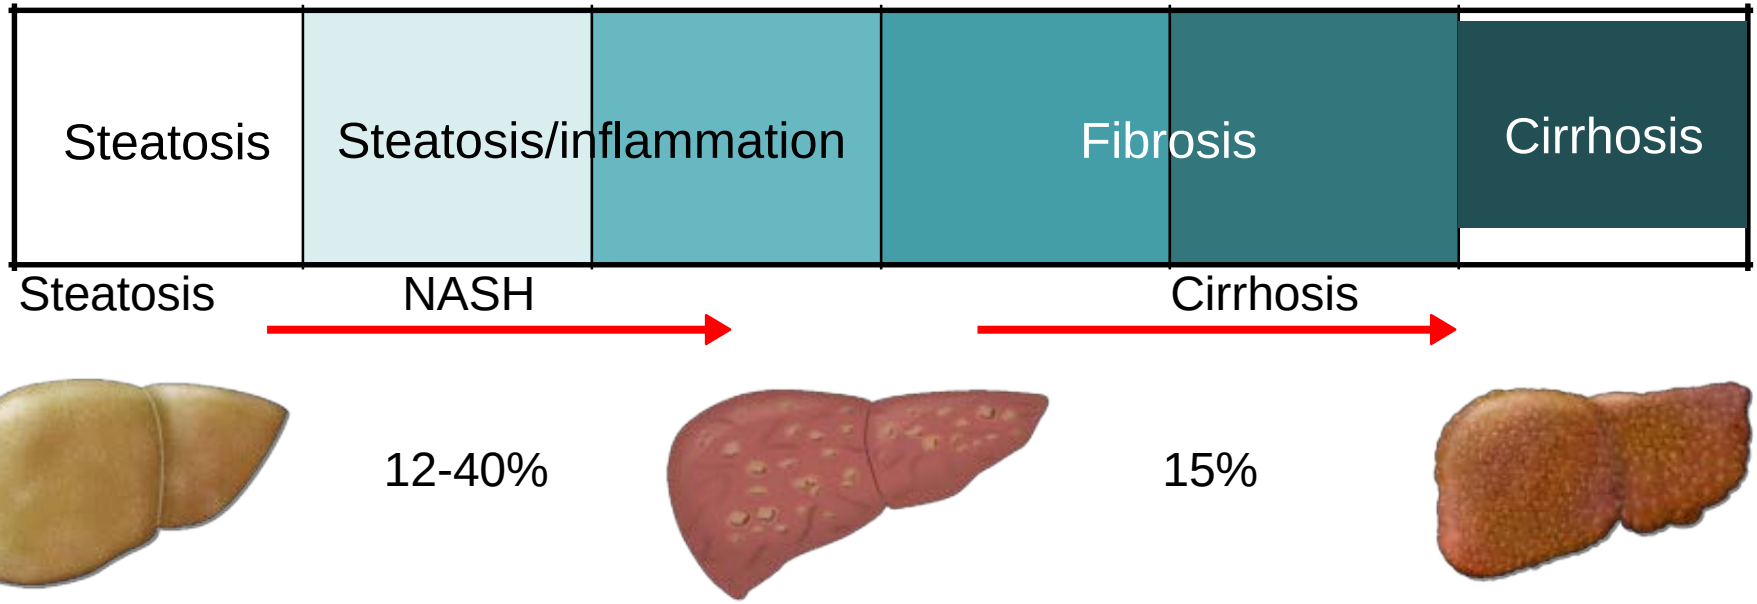
- 7.8% >F2 fibrosis by FibroScan (10% FIB-4, 8.6% APRI)

- Multivariate analysis
  - Significant Fibrosis associated with HIV RNA and ALT at baseline
  - Not associated with BMI or use of anti-lipid therapy

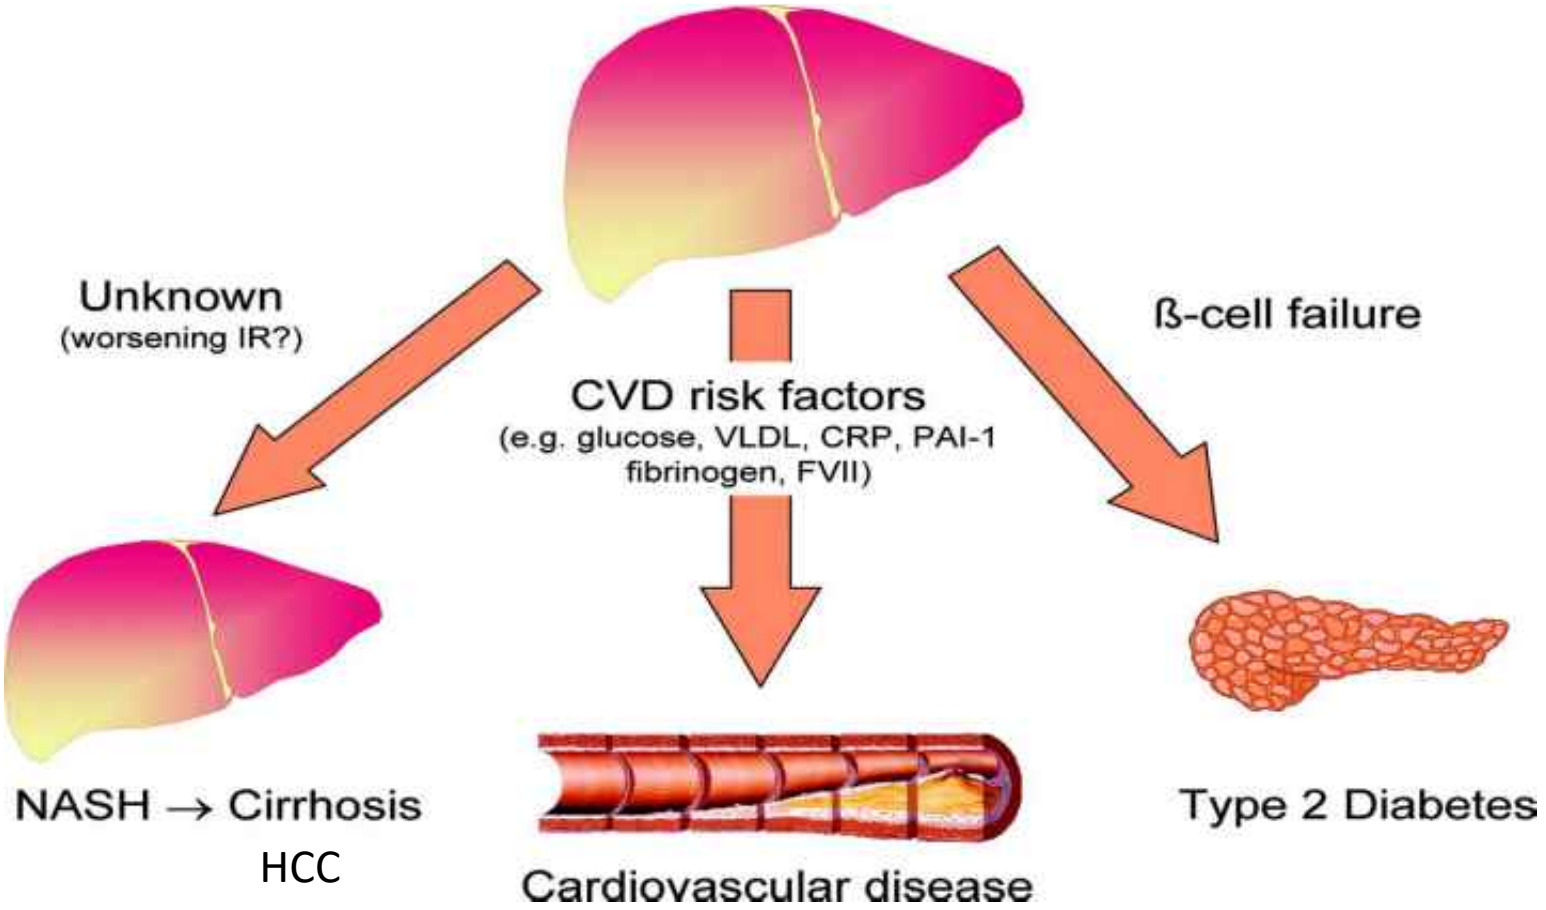
Matthews et al, HIV Medicine, 2014

What is NAFLD ?

- Non-Alcoholic Fatty Liver Disease
- Wide disease range from simple steatosis to cirrhosis



NAFLD: Potential consequences of the metabolic syndrome



Kotronen, Arterioscler Thromb Vasc Biol 2008

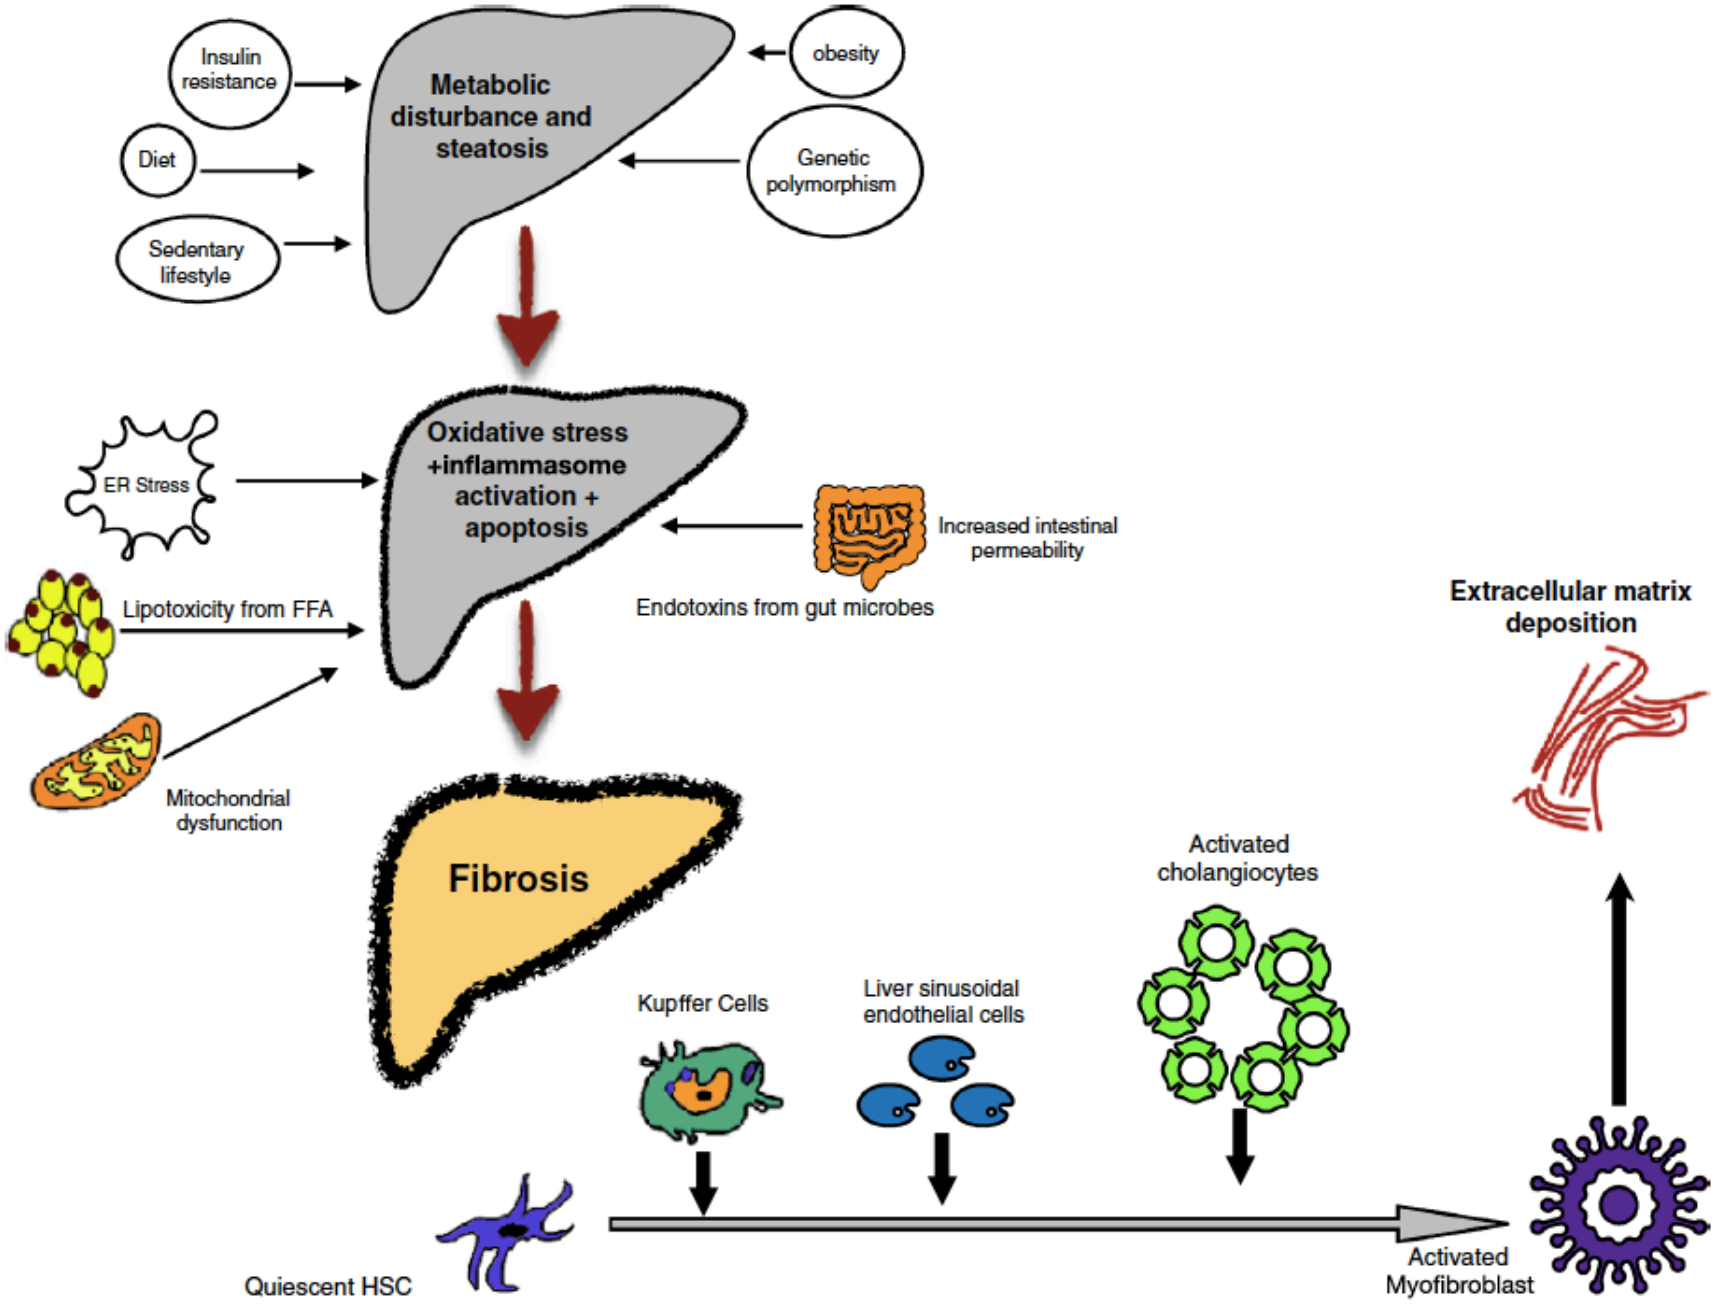


Fig. 1 Pathogenesis and progression of non-alcoholic fatty liver disease

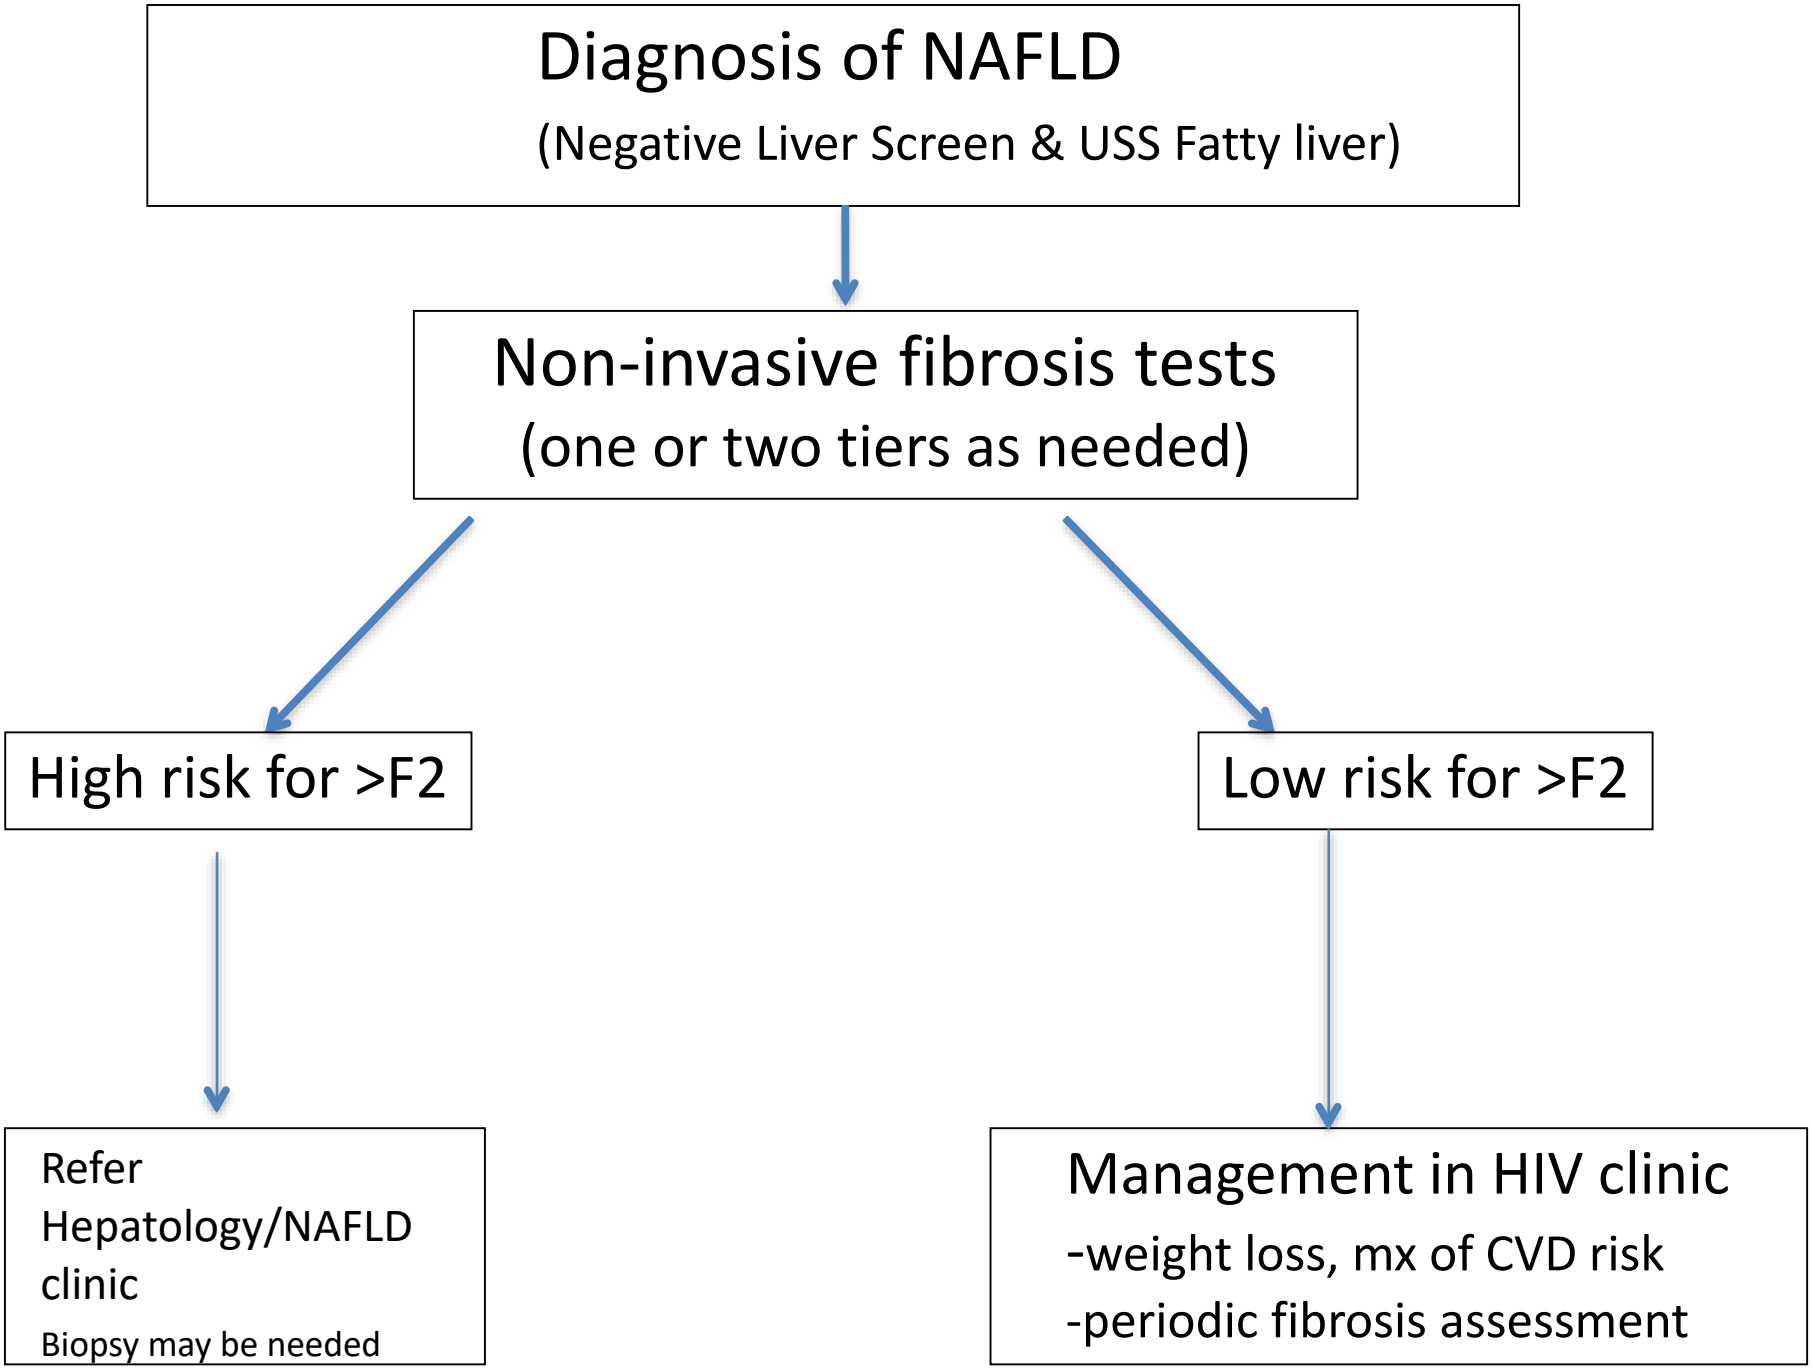
Imperial College London

NAFLD IN HIV INFECTED PATIENTS

Study	country	n subjects	Steatosis assessment	Prevalence of NAFLD
Hadigan, C 2007 JAIDS	USA	33	MR spectrometry	42%
Mohammed, SS 2007 JAIDS	Canada	26	Liver Biopsy	45%
Guaraldi, G 2008 CID	Italy	225	CT	37%
Crum Cianflone, P 2009 JAIDS	USA	216	Ultrasound	31%
Ingiliz, P 2009 Hepatol	France	30	Liver Biopsy	60%
Nishijima, T 2014 PlosOne	Japan	435	Ultrasound	31%
Price, JC 2014 Am J Gastro	USA	465 HIV and HIV HCV	CT	15%
Juan, M 2014 AIDS	Spain	505 HIV HCV/HBV	CAP™	40%

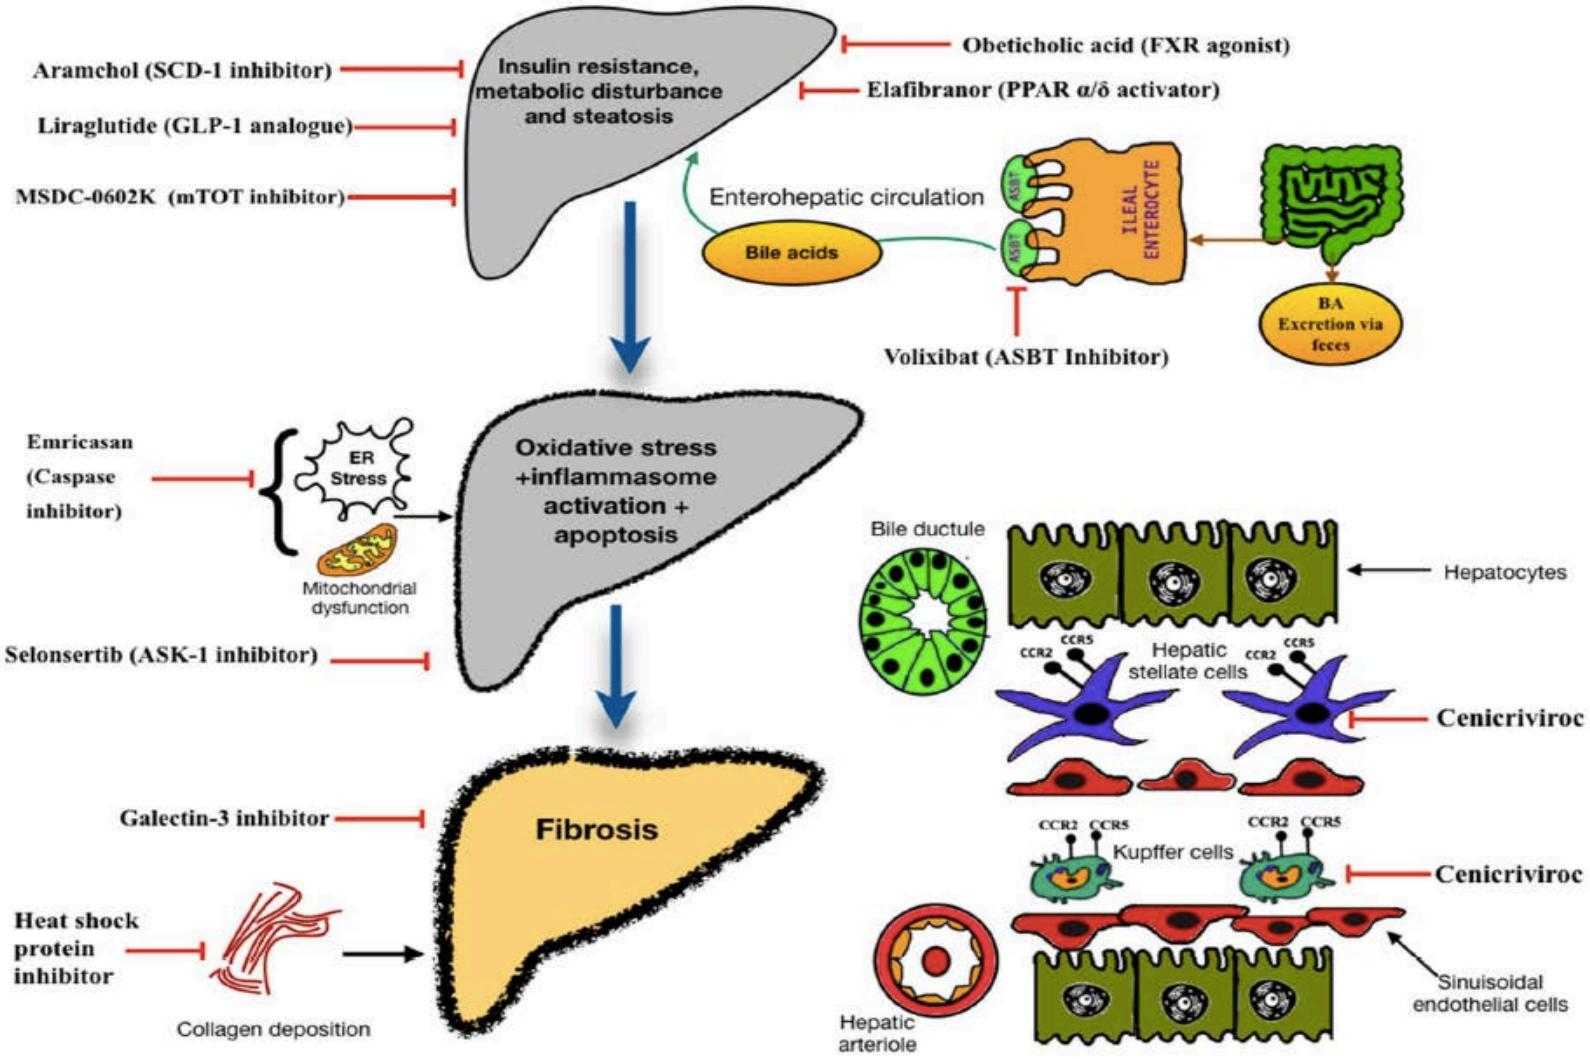


Diagnosis of NAFLD
(Negative Liver Screen & USS Fatty liver)
Non-invasive fibrosis tests
(one or two tiers as needed)
High risk for >F2
Low risk for >F2
Refer Hepatology/NAFLD clinic
Biopsy may be needed
Management in HIV clinic
-weight loss, mx of CVD risk
-periodic fibrosis assessment

Appropriate End-points for therapeutics in NAFLD

- Early phase trials
  - Populations with NASH or at high-risk of NASH
  - Primary end-points based on mechanism of drug tested; e.g. reduction in hepatic fat by MR-Proton Density Fat Fraction, CAP
- Phase 3 studies
  - Biopsy proven NASH (NAS score >2) with F2+ fibrosis
  - Primary End-point
    - Complete resolution of steatohepatitis and no worsening of fibrosis
    - At least one point improvement in Fibrosis score with no worsening of steatohepatitis

Therapeutics for NASH – the NAFLD pipeline



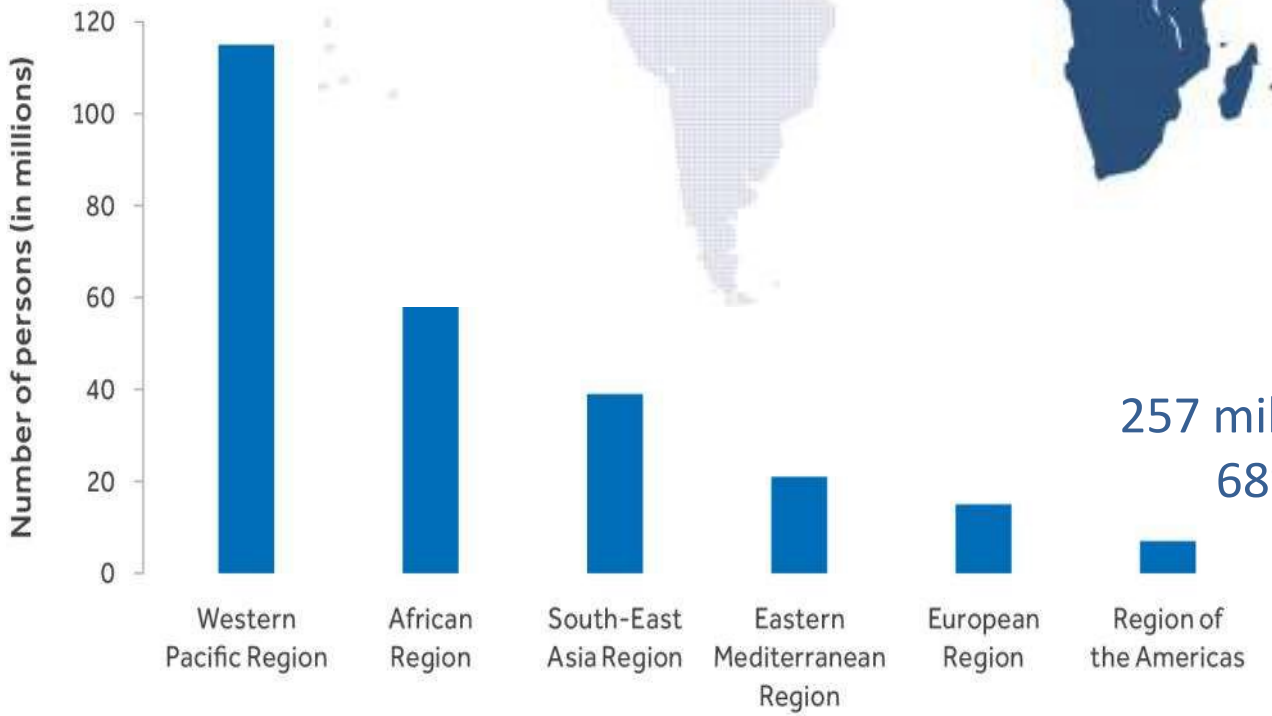
What works and what doesn't work – data to date…

- Diet/exercise
  - 5% weight loss improves steatosis
  - 7% improvement in inflammation
  - >10% for improvement in fibrosis
- Insulin sensitising agents
  - Glitazones/Metformin – ?effective in pre-diabetics/T2DM
- Anti-lipid therapies
  - Fibrates, statins may improve lipids BUT no/little effect on hepatic inflammation/fibrosis
- Anti-oxidants
  - Vitamin E works (but risk of Prostate cancer??)

GLOBAL STATUS OF HEPATITIS B

Incidence:

Chronic HBV infection in children under 5
reduced from 4.7% to 1.3% (immunization)

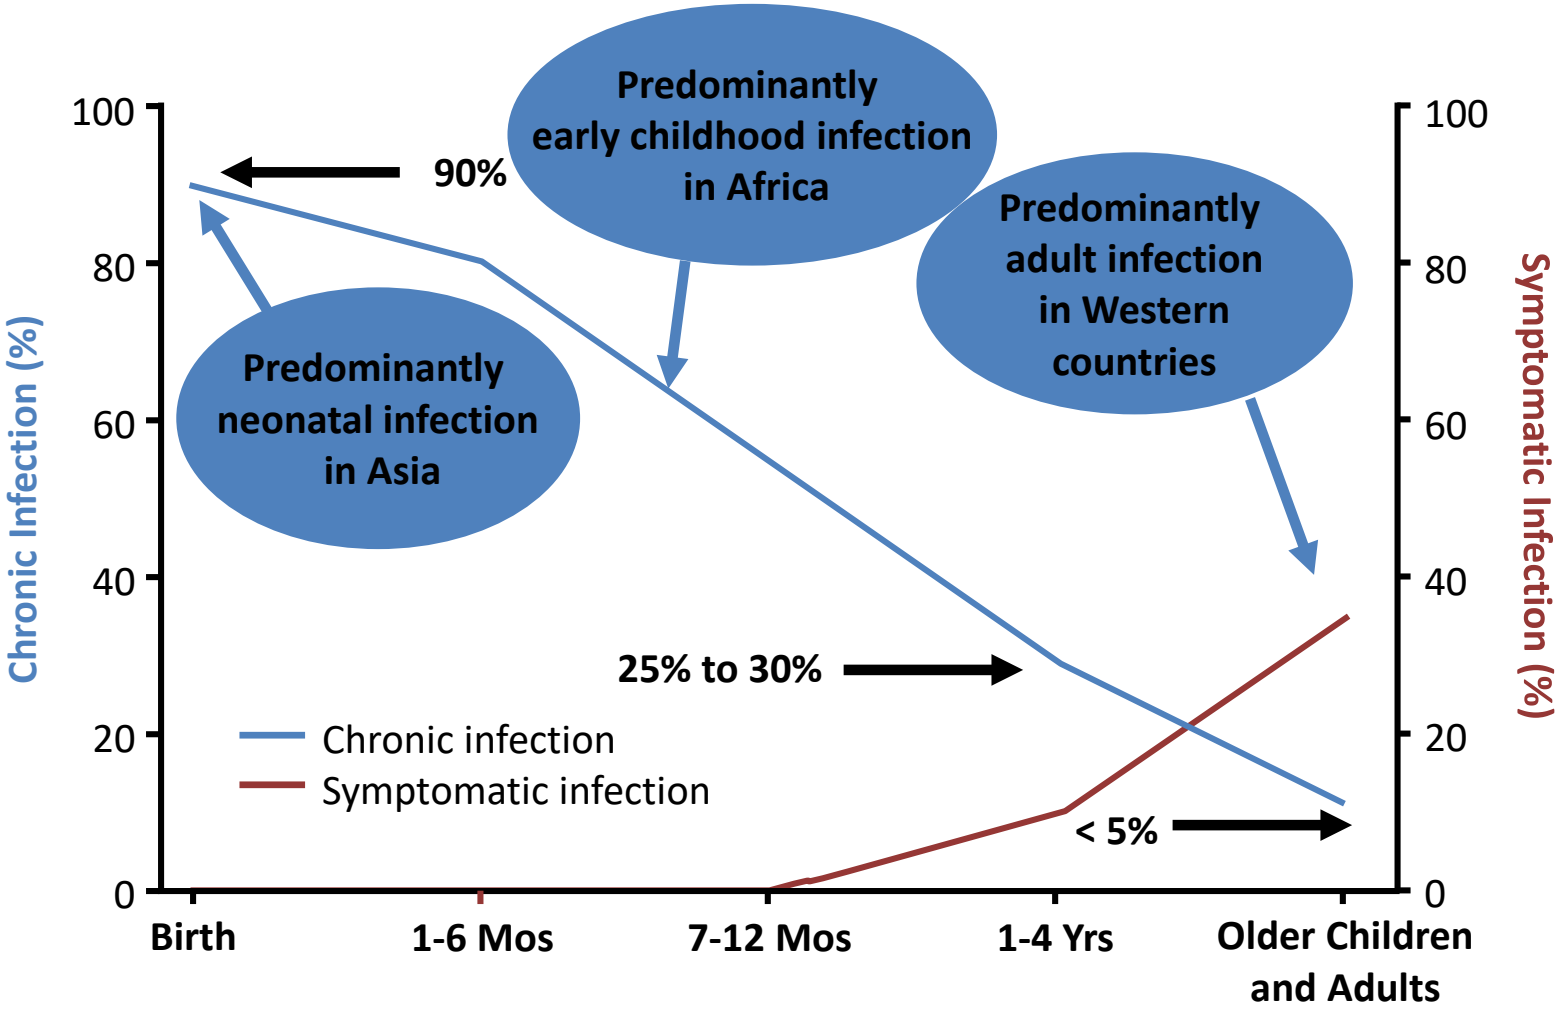


Prevalence:

257 million people living with HBV
68% in Africa /Western Pacific

WHO Global Hepatitis Report 2017

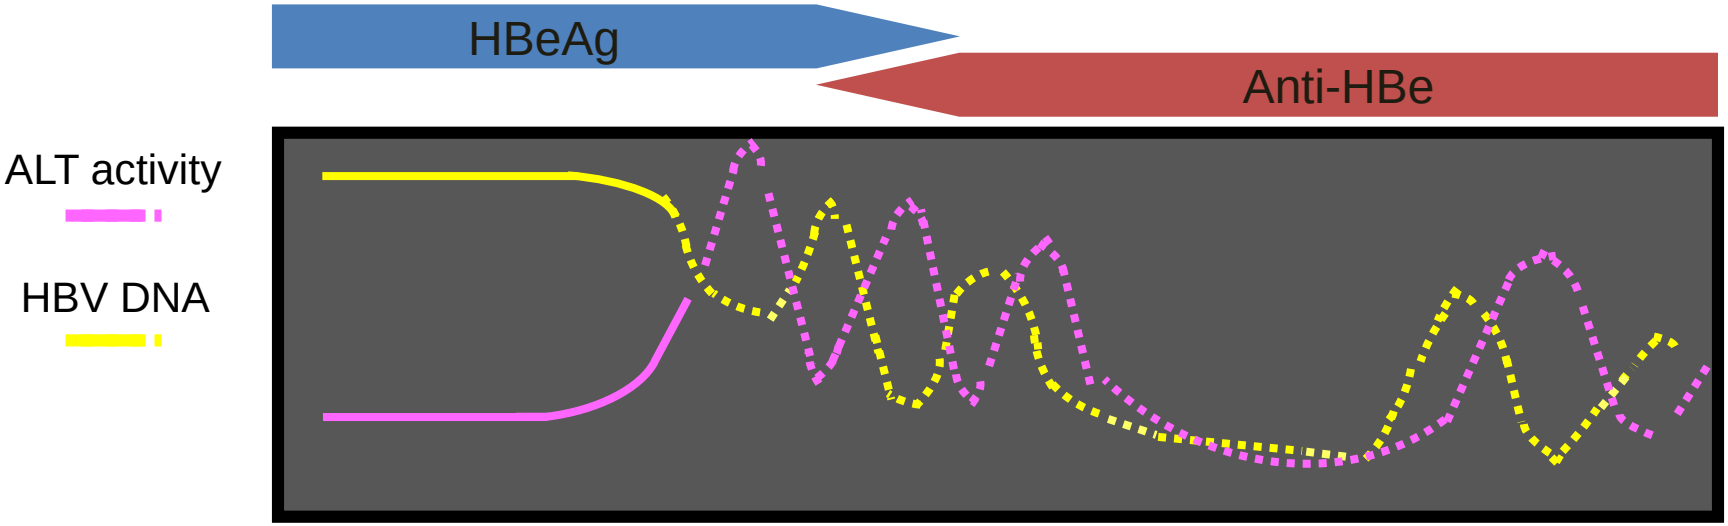
Outcome of HBV Infection by Age of Transmission



Adapted from Stanford Asian Liver Center. 2007 physician's guide to hepatitis B: a silent killer.

4 Phases of Chronic HBV Infection

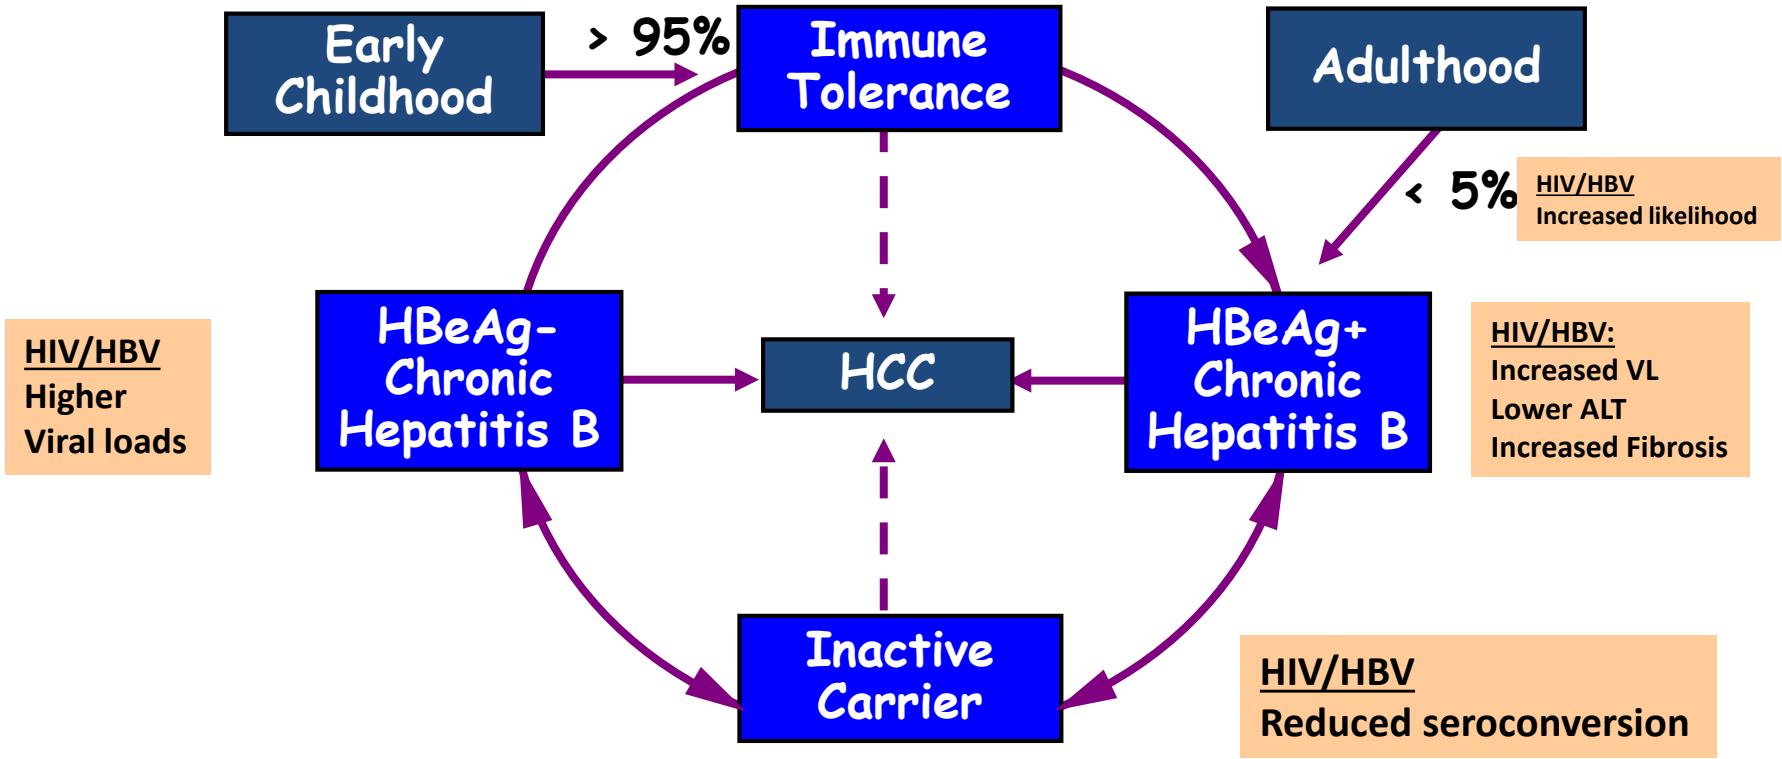
Current Understanding of HBV Infection



Phase	Immune Tolerant	Immune Clearance	Inactive Carrier State	Reactivation
Liver	Minimal inflammation and fibrosis	Chronic active inflammation	Mild hepatitis and minimal fibrosis	Active inflammation

Yim HJ, et al. Natural history of chronic hepatitis B virus infection: what we knew in 1981 and what we know in 2005. Hepatology. 2006;43:S173-S181.

Natural history of HBV infection – where does HIV co-infection fit in?



Chen DS, *et al. J Gastroenterol Hep.* 1993;8:470–475; Seeff L, *et al. N Engl J Med.* 1987;316:965–970

Do we really need all this complexity?

	HBeAg positive		HBeAg negative	
	Chronic infection	Chronic hepatitis	Chronic infection	Chronic hepatitis
HBsAg	High	High/intermediate	Low	Intermediate
HBeAg	Positive	Positive	Negative	Negative
HBV DNA	>10^7 IU/ml	10^4-10^7 IU/ml	<2,000 IU/ml°°	>2,000 IU/ml
ALT	Normal	Elevated	Normal	Elevated*
Liver disease	None/minimal	Moderate/severe	None	Moderate/severe
Old terminology	Immune tolerant	Immune reactive HBeAg positive	Inactive carrier	HBeAg negative chronic hepatitis

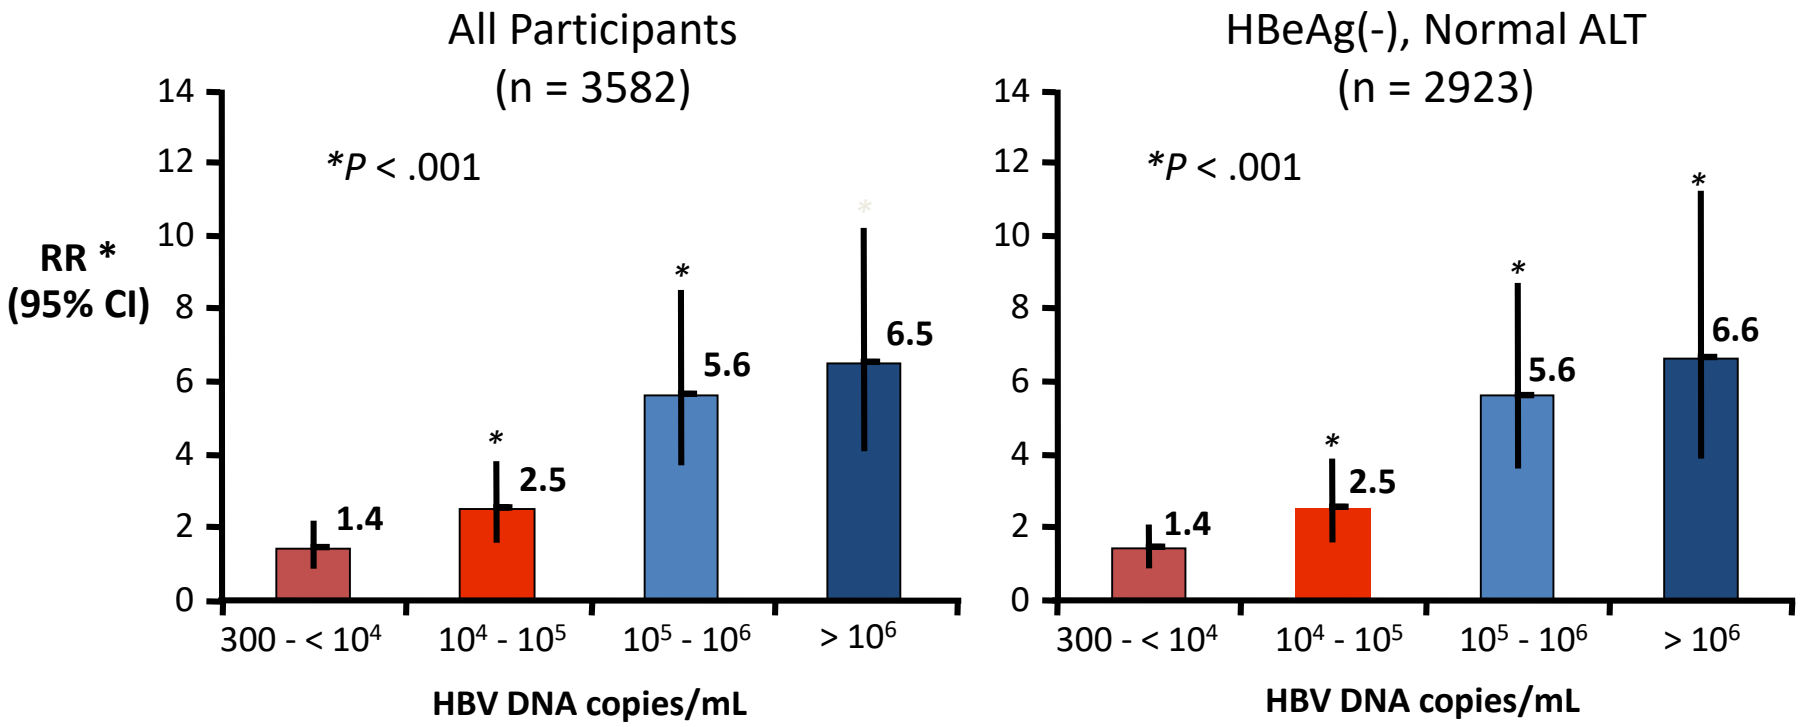
EASL HBV Guidelines 2017

When do we need to Rx HBV?

- Everybody with detectable HBV DNA?
- Based on HBV DNA levels?
- Those with evidence of significant liver disease?
  - Based on abnormal ALTs?
  - Histological activity/Fibrosis scores?

Level of HBV DNA (c/ml) at entry & progression to cirrhosis and risk of HCC

3582 HBsAg untreated asian carriers
mean follow-up 11 yrs → 365 patients newly diagnosed with cirrhosis

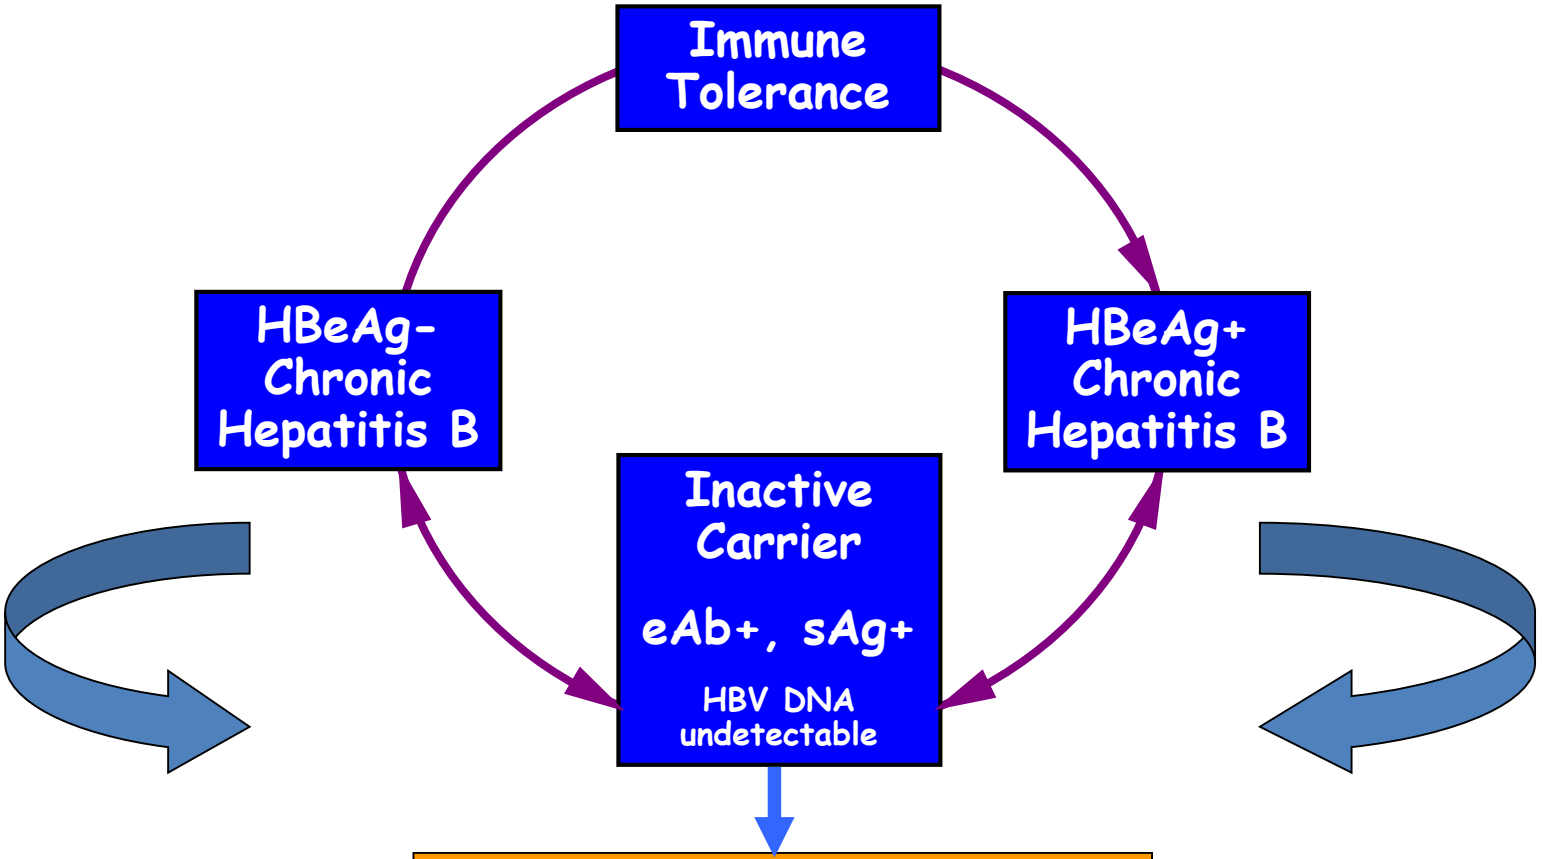


* Adjusted for age, sex, cigarette smoking, and alcohol consumption.

HBV-DNA viral load (> 10^4 cp/ml) strongest predictor of progression to cirrhosis independent of ALT and HBeAg status

Iloeje UH, Gastroenterology 2006; 130: 678-686

What does Rx aim to achieve?

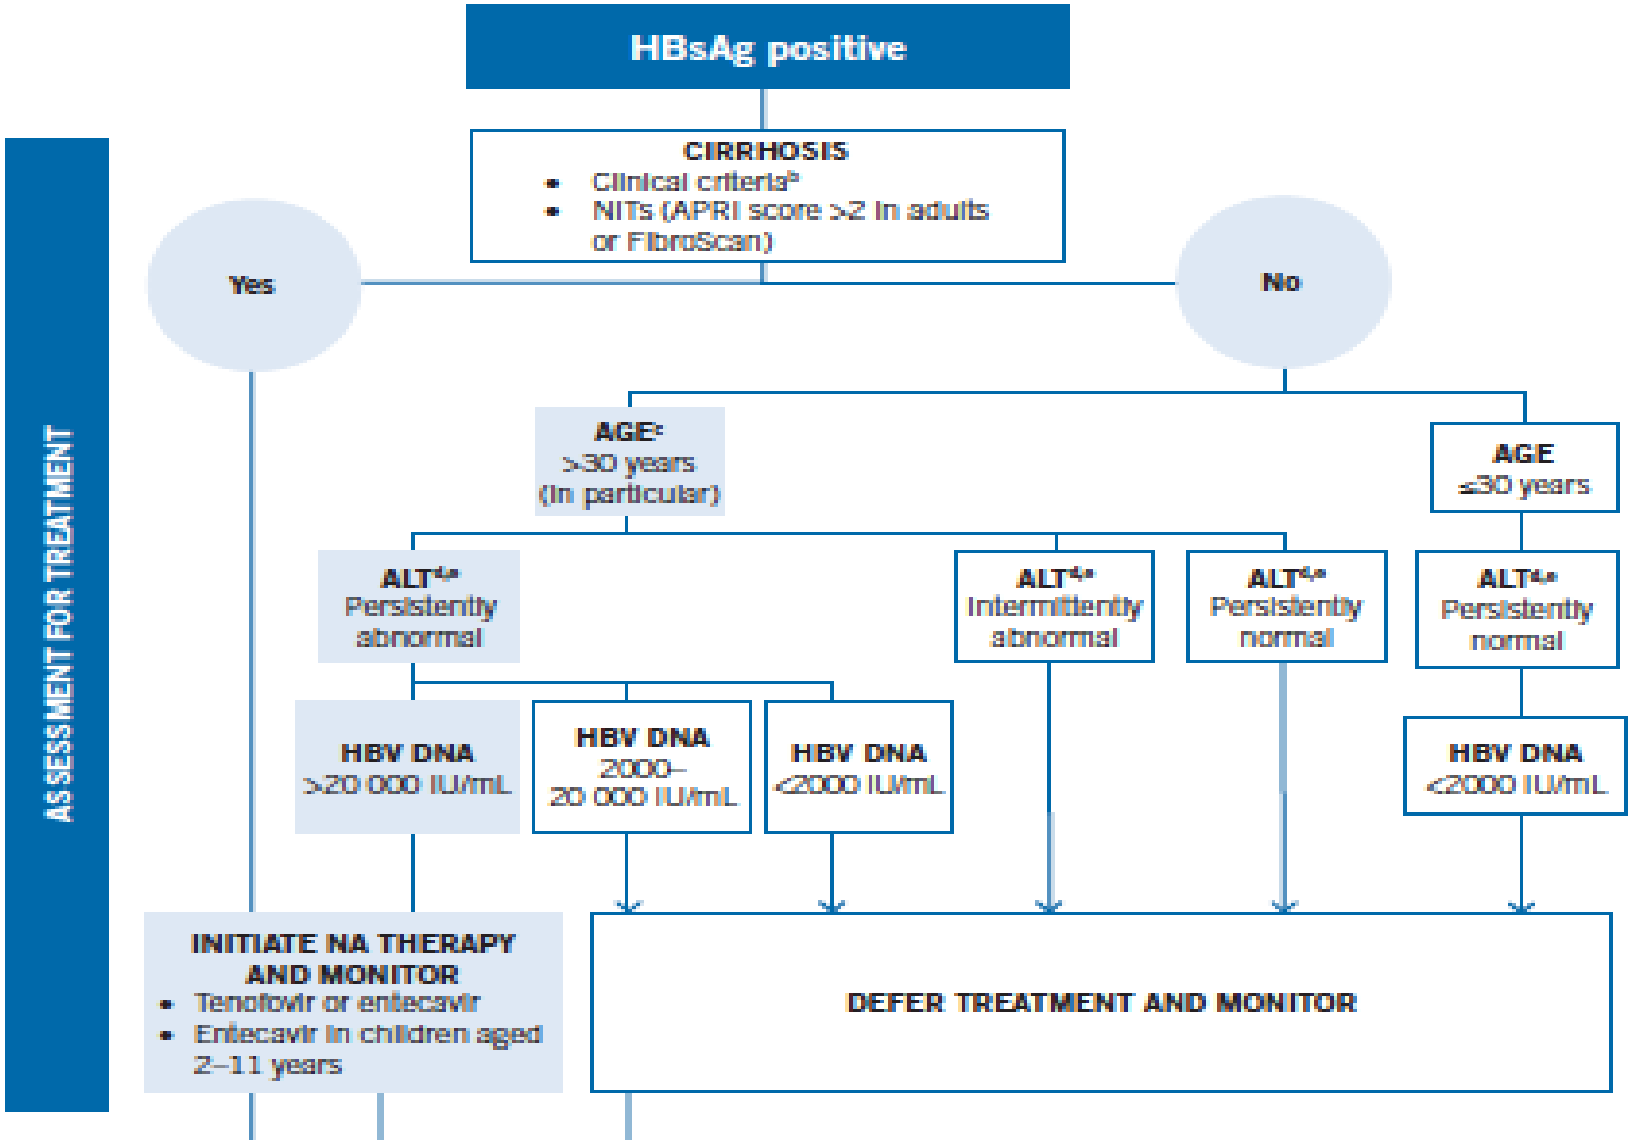


Viral Replication (HBV DNA)
Anti-HBe sero-conversion
HBsAg Loss
Anti-HBs sero-nversion
Clearance cccDNA

Three key inter-linked factors in the decision to treat

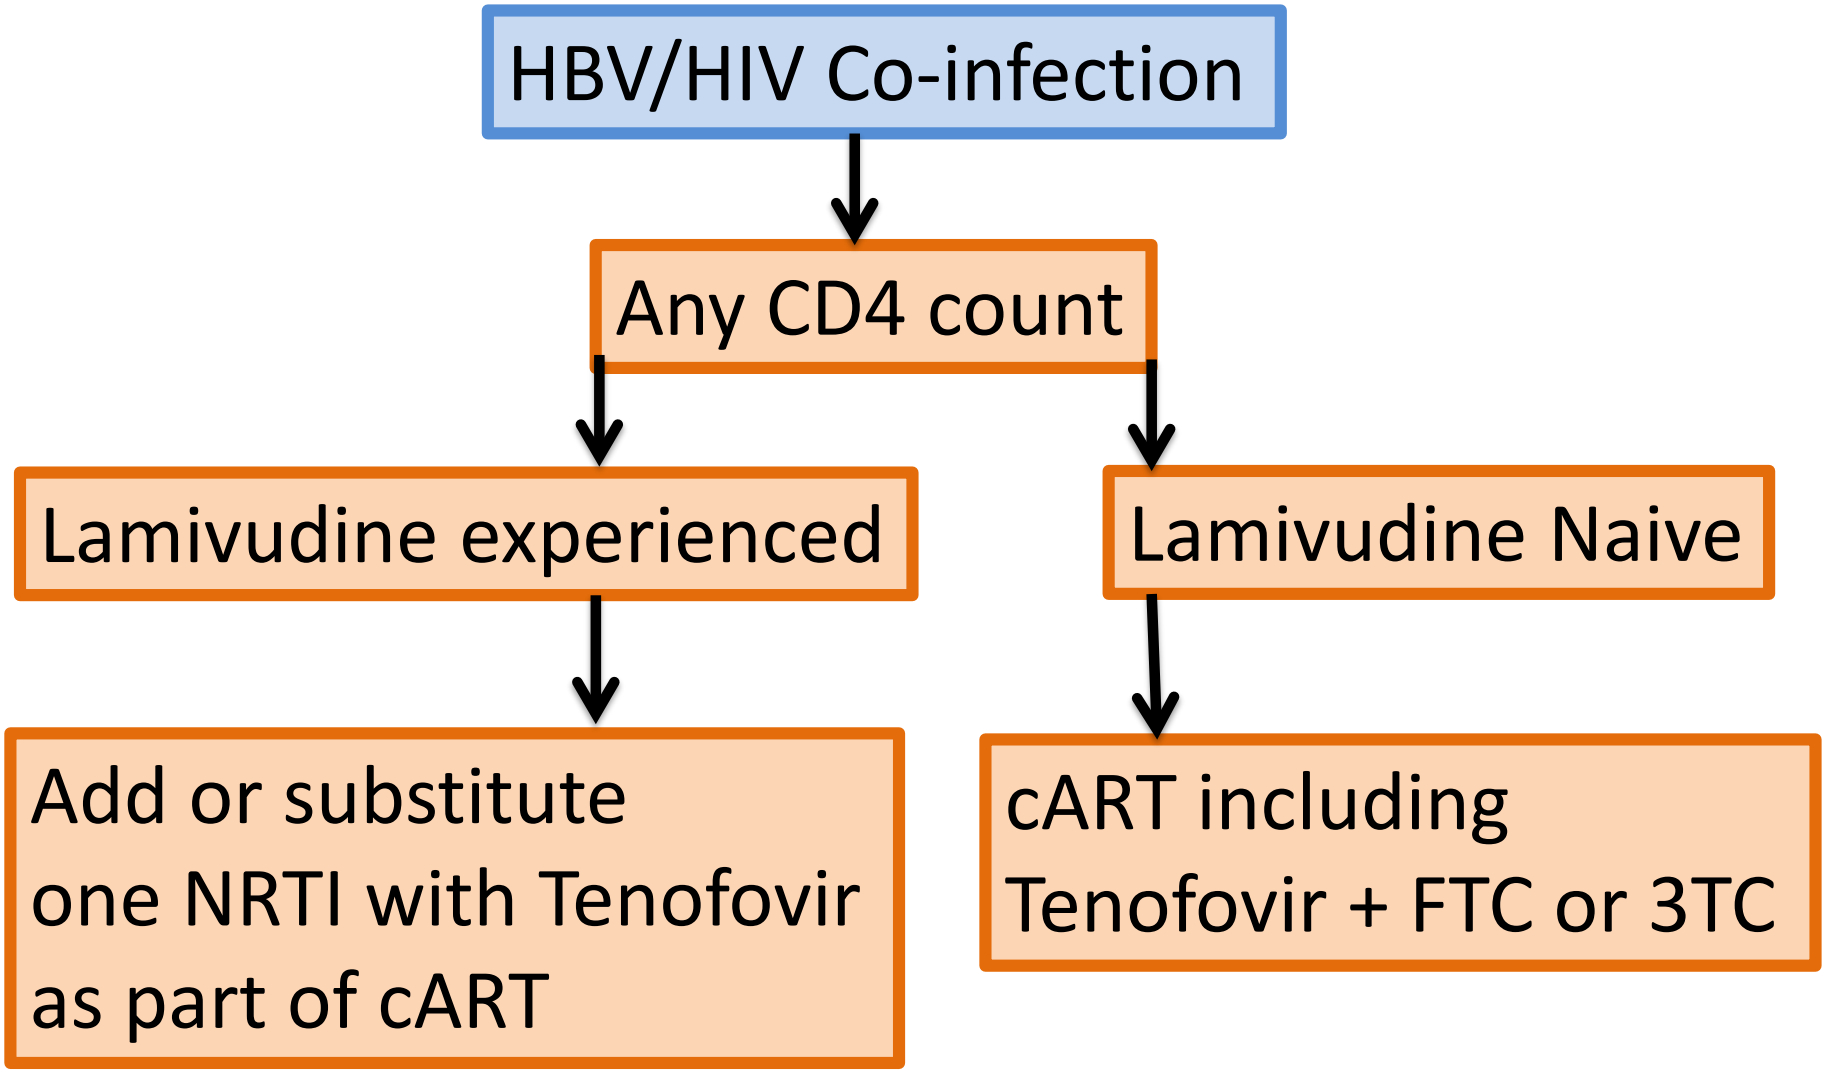
- Age
  - <30yrs vs. >30yrs
  - FH of HCC
- Level of fibrosis/inflammation
  - Cirrhosis
  - F2+ fibrosis
  - Abnormal liver enzymes
- HBV DNA levels
  - >20 000 IU/ml

ALGORITHM OF WHO RECOMMENDATIONS ON THE MANAGEMENT OF PERSONS WITH CHRONIC HEPATITIS B INFECTION[a]



WHO Guidelines 2015

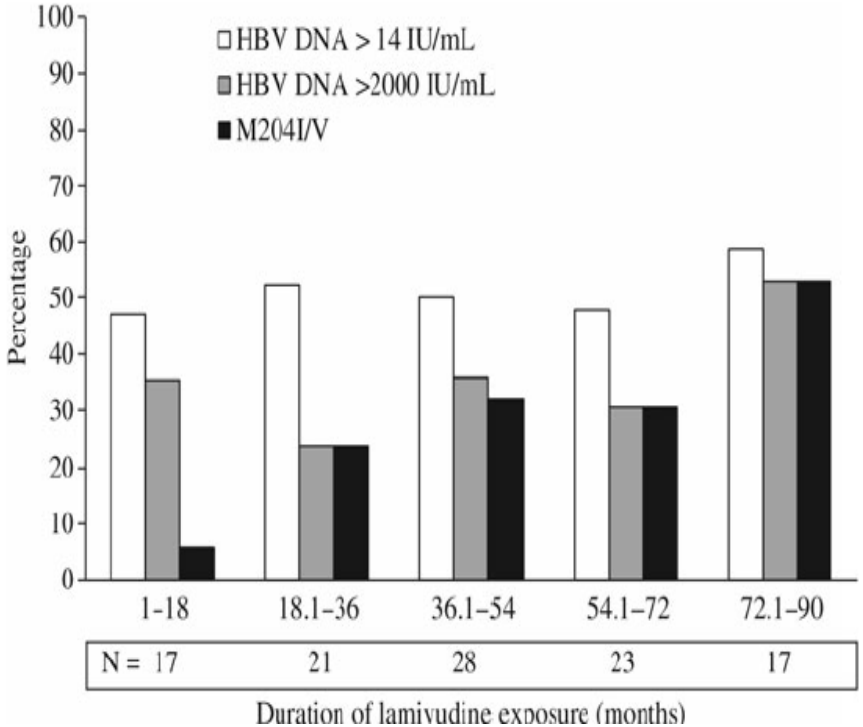
EACS Guidelines 2018

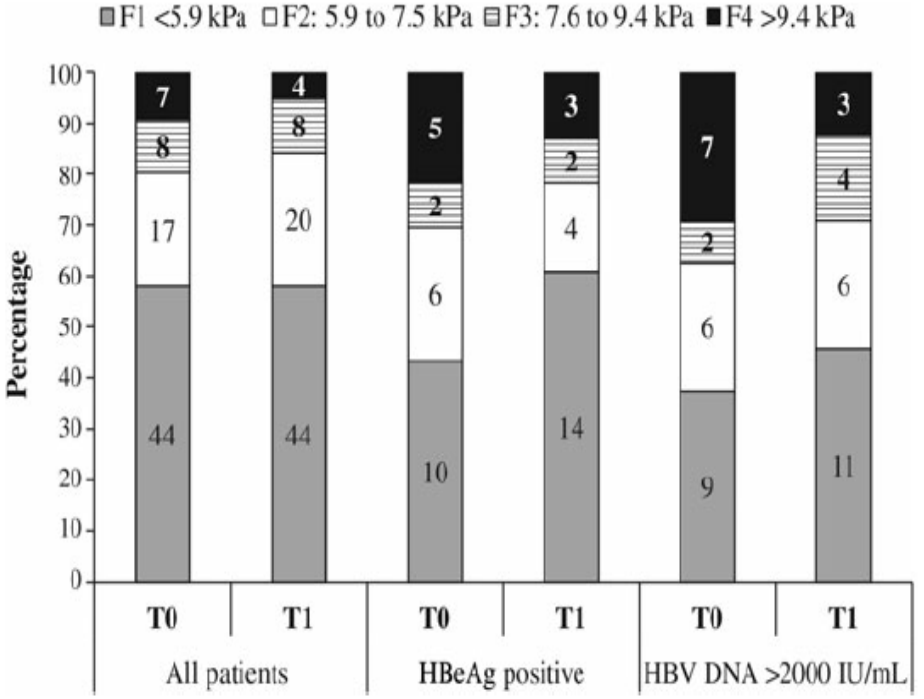


Clinical Infectious Diseases Advance Access published June 16, 2015

MAJOR ARTICLE

Liver Fibrosis by Transient Elastography and Virologic Outcomes After Introduction of Tenofovir in Lamivudine-Experienced Adults With HIV and Hepatitis B Virus Coinfection in Ghana

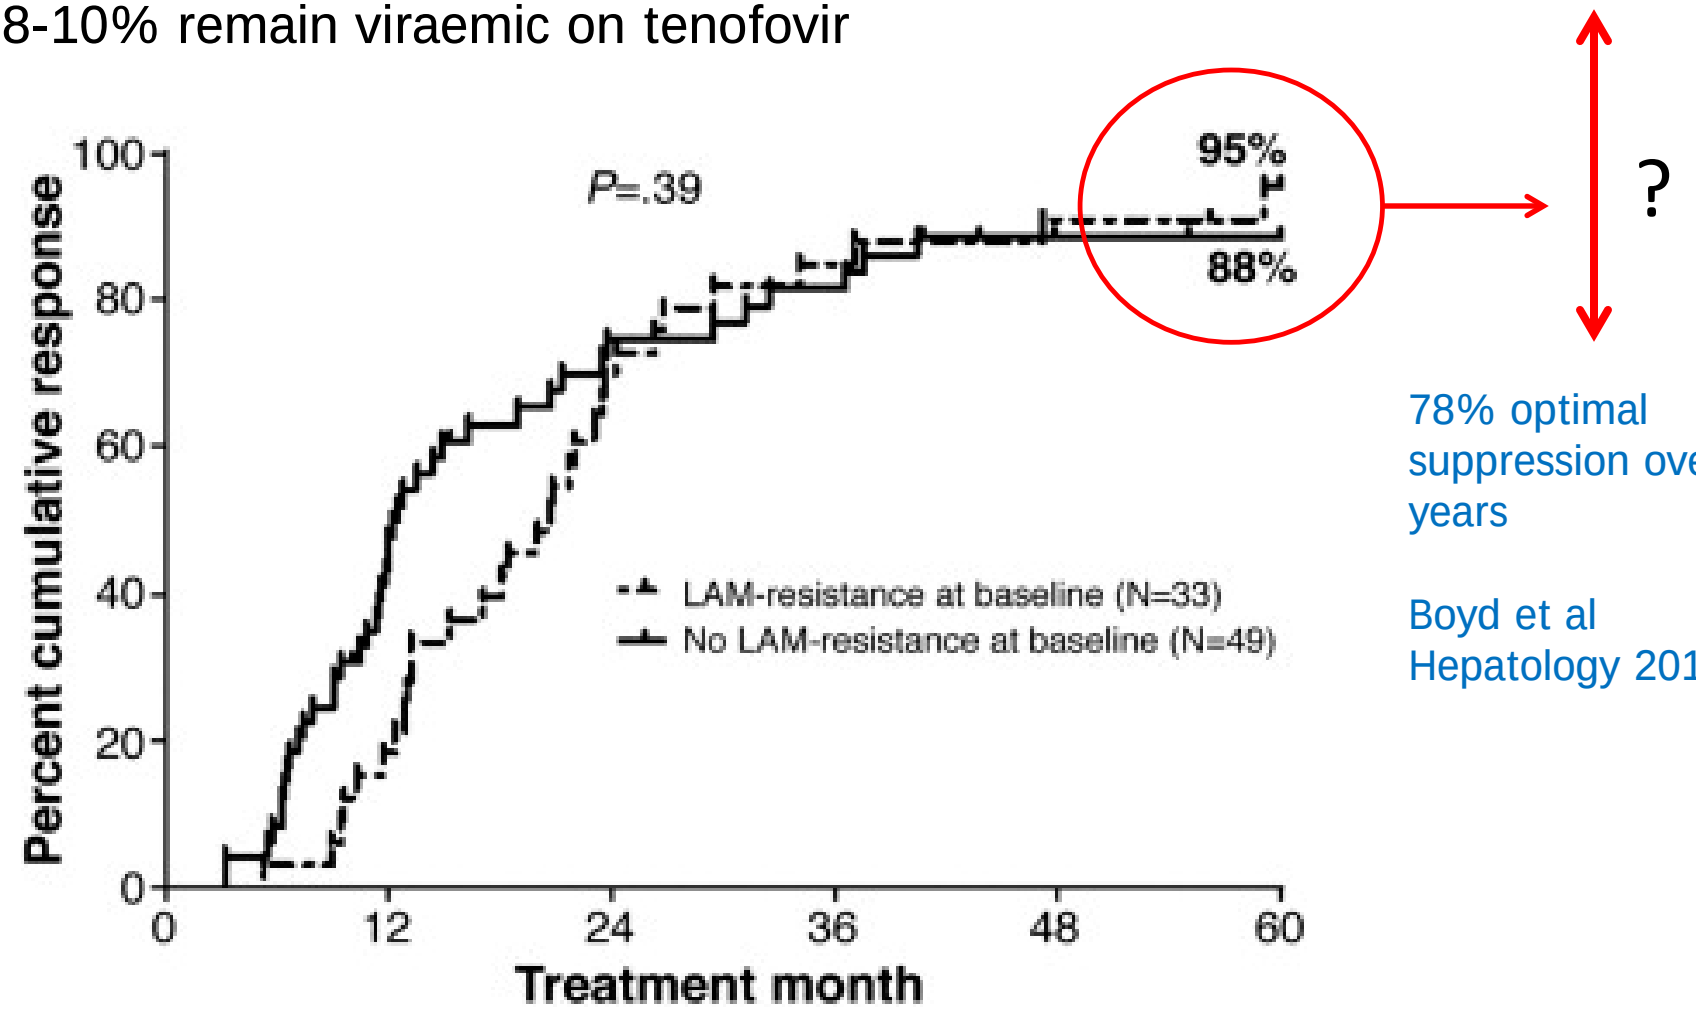




Stockdale, et al. Clin Infect Dis; 2015

Efficacy is never 100%

8-10% remain viraemic on tenofovir



78% optimal suppression over 7 years

Boyd et al Hepatology 2014

De Vries Slujis Gastroenterology 2010

Factors associated with detectable HBV DNA

- On truvada based therapy at least 6 months
- Undetectable HIV RNA < 400 c/ml

	OR	95% CI	p-value
Age (per 10 yrs)	0.90	0.48, 1.69	0.74
HBeAg positive	12.06	3.73, 38.98	<0.0001
<95% adherent	2.52	1.16, 5.48	0.02
HAART <2 yrs	2.64	1.06, 6.54	0.04
CD4 < 200 cells/mm^3	2.47	1.06, 5.73	0.04

Long term adherence is always a challenge

Matthews CID 2012

Prophylaxis Effect of TDF in Prevention of HBV Acquisition in HIV (+) Patients

- HIV infected; HBV uninfected MSM
- Patients were serologically evaluated for HBV infection stratified by NRTI-ART

Frequency and Hazard Ratio of HBV Incident Infection

ART	Observation Period (Person-Years)	Incident Infection	HR (95% CI)	P-Value
No ART	446	30	1	
Other ART	114	6	.924 (.381-2.239)	.861
ART containing (LAM, TDF, or FTC)	1047	7	.113 (1.049-.261)	<.001
LAM-ART	814	7		
TDF-ART	233	0		

TDF containing ART resulted in zero HBV infections[1]

Statistically longer HBV-free survival with TDF compared to 3TC or no treatment (p = 0.004 and 0.001) [2]

1. Gatanama,H, et al., *CID* 2013:56 June 15
2. Heuft, M, et al. CROI 2013. Oral Abstract Session 9, paper 33

Renal impairment with TDF

- 240 patients with a 3year-time follow-up, normal eGFR at baseline1

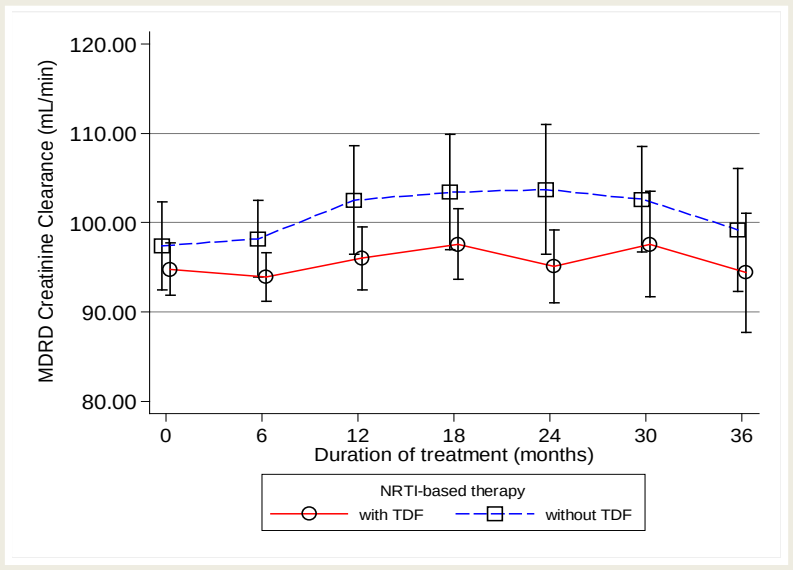


Figure 1: MDRD clearance over time

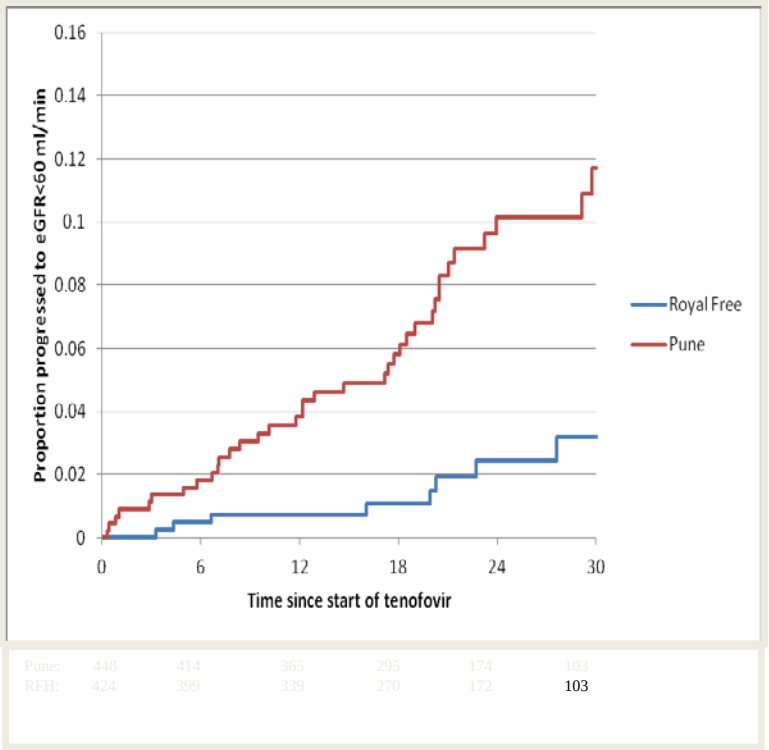
- >400 HIV+ patients receiving TDF

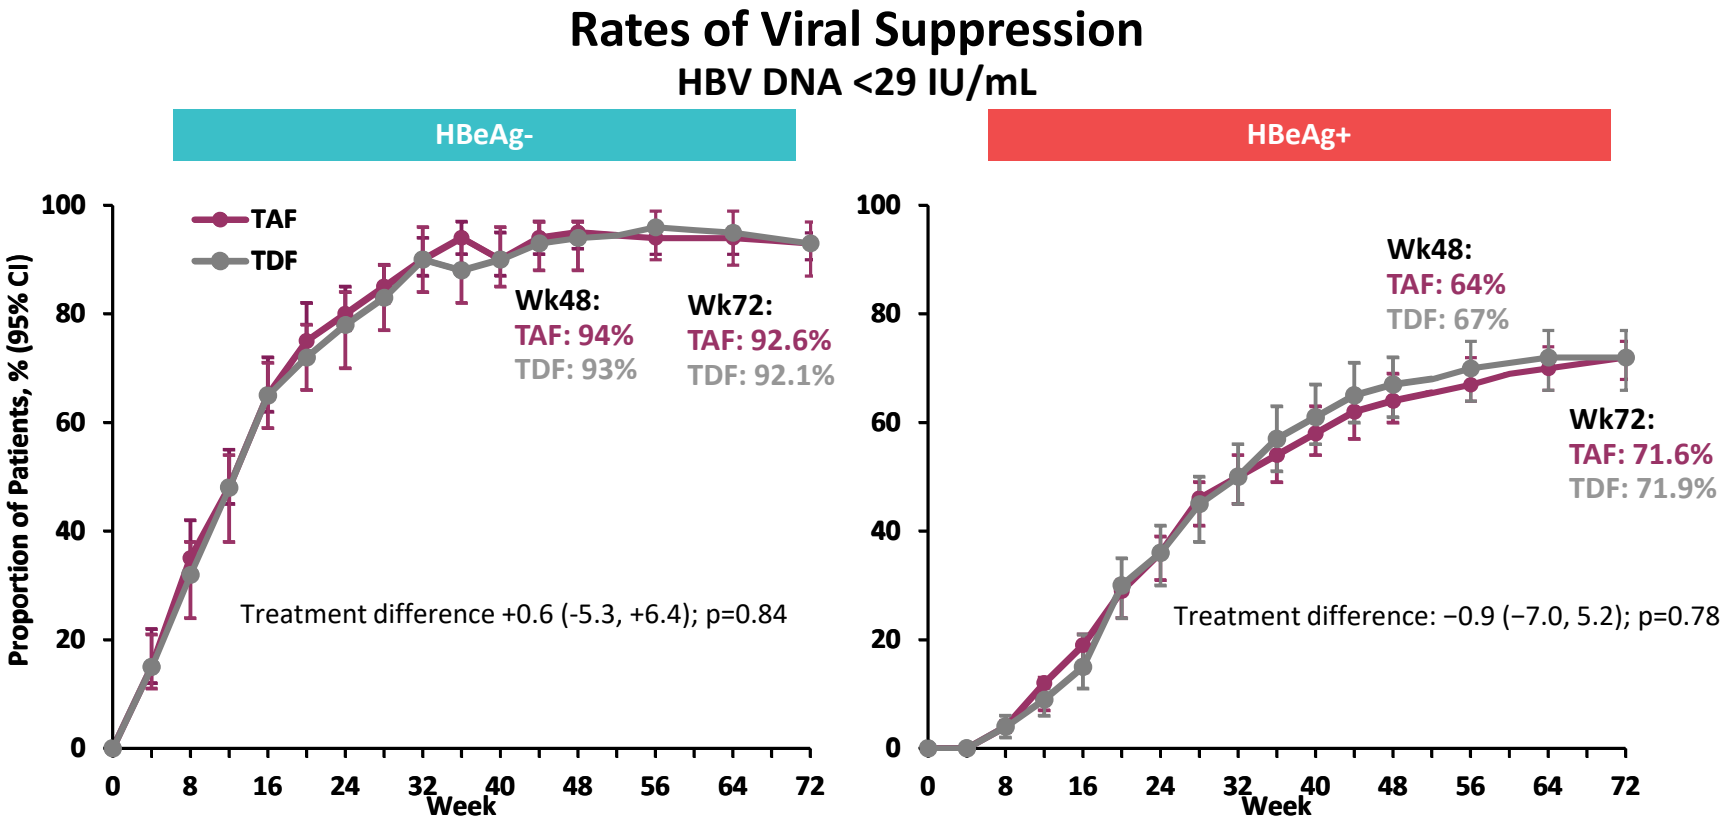


Pujari, et al, BMC Infect Dis 2014

Strategies when TDF is contra-indicated?

- Switch to Entecavir (caution if LAM-R)
- Switch to Tenofovor Alafenamide

Antiviral Efficacy of TAF and TDF at Week 72



- HBV DNA suppression rates were lower in HBeAg+ vs HBeAg− patients
- No significant difference between TAF and TDF
- No resistance was detected through 48 weeks

HBV DNA suppression was comparable between TAF and TDF treatment up to Week 72

Duantel and Zoulim, J Hepatol 2016; 64: S117

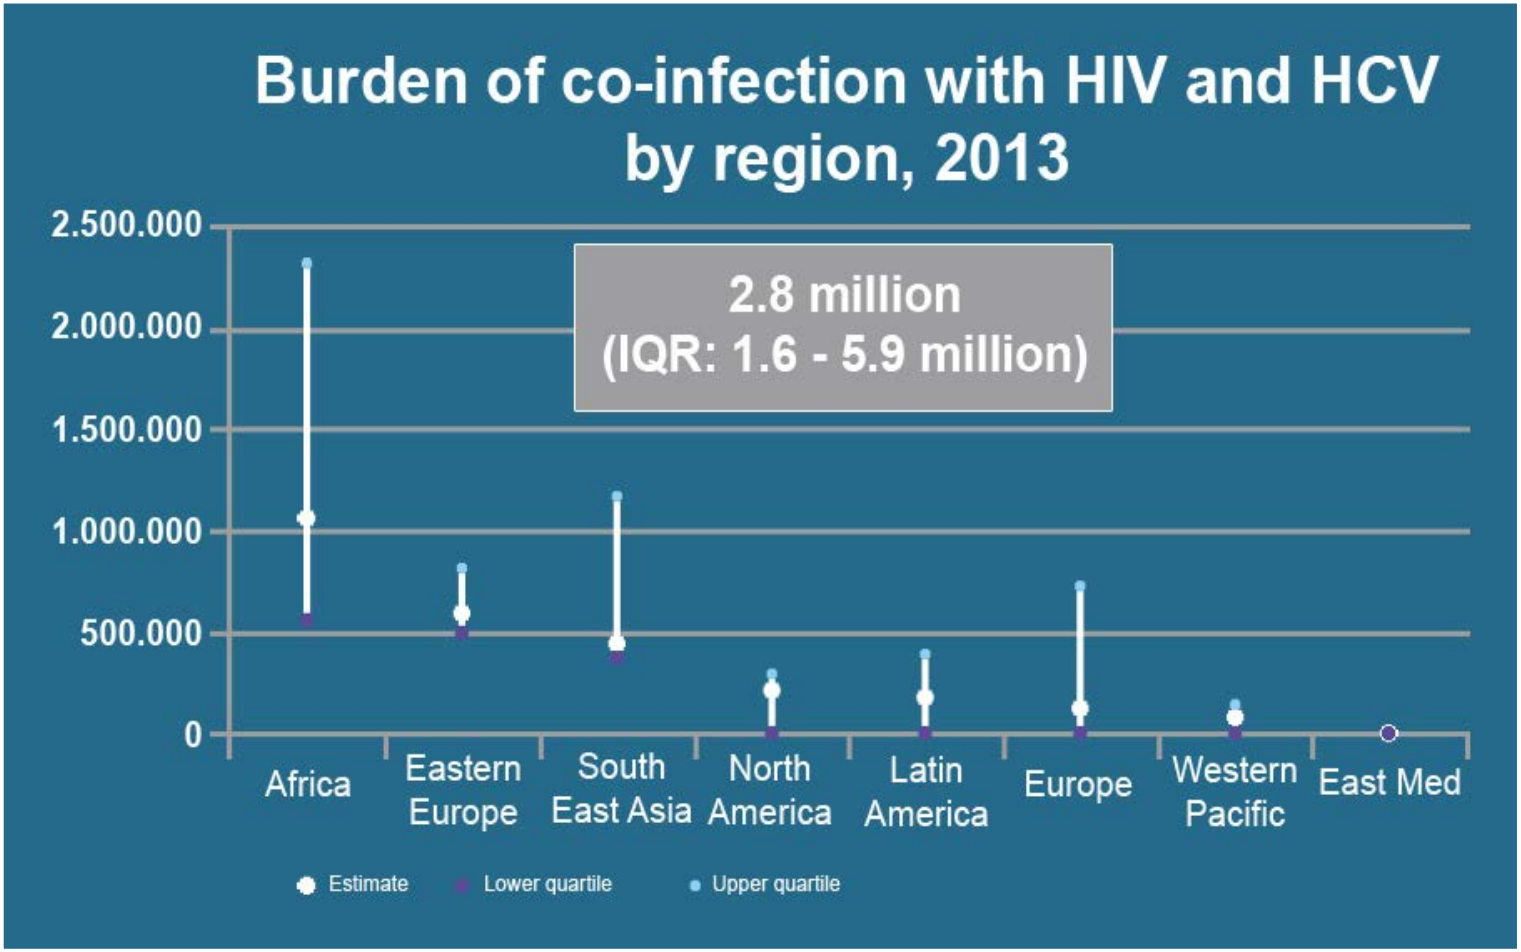
Burden of HCV in HIV populations



P Easterbrook, IAS 2015

HIV/HCV – double-trouble for the liver

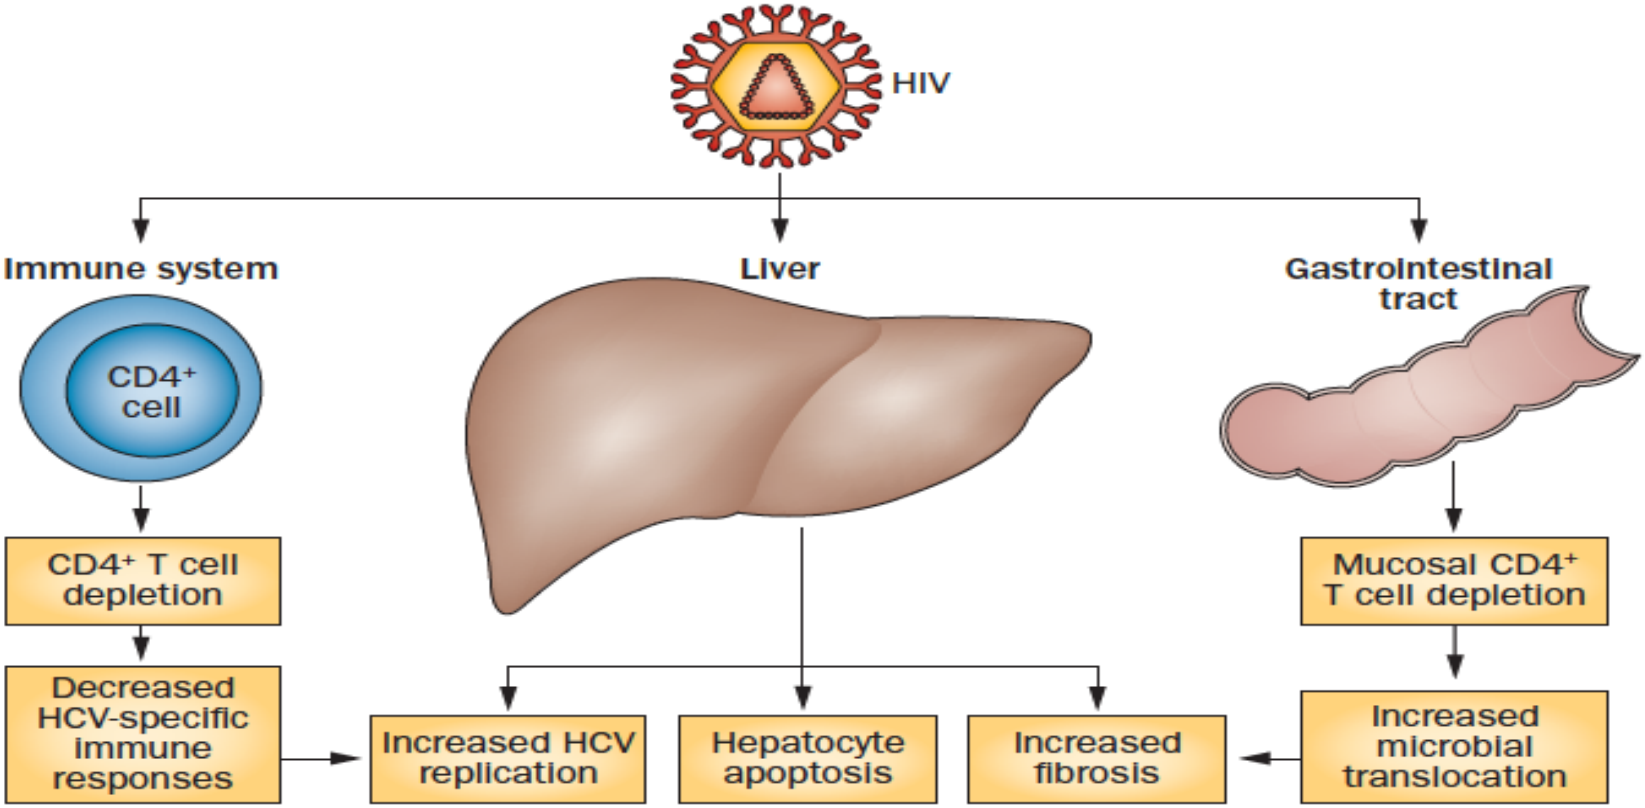


Figure 1 | Driving factors underlying liver disease pathogenesis in HCV–HIV co-infection. HIV infection leads to an impaired immune response against HCV, increased HCV replication, hepatic inflammation and apoptosis, increased microbial translocation from the gastrointestinal tract and increased fibrosis.

Chen J Nat Rev Gastroenterol Hep 2014
doi:10.1038/nrgastro.2014.17

Faster progression even when controlling for alcohol and other co-morbidities

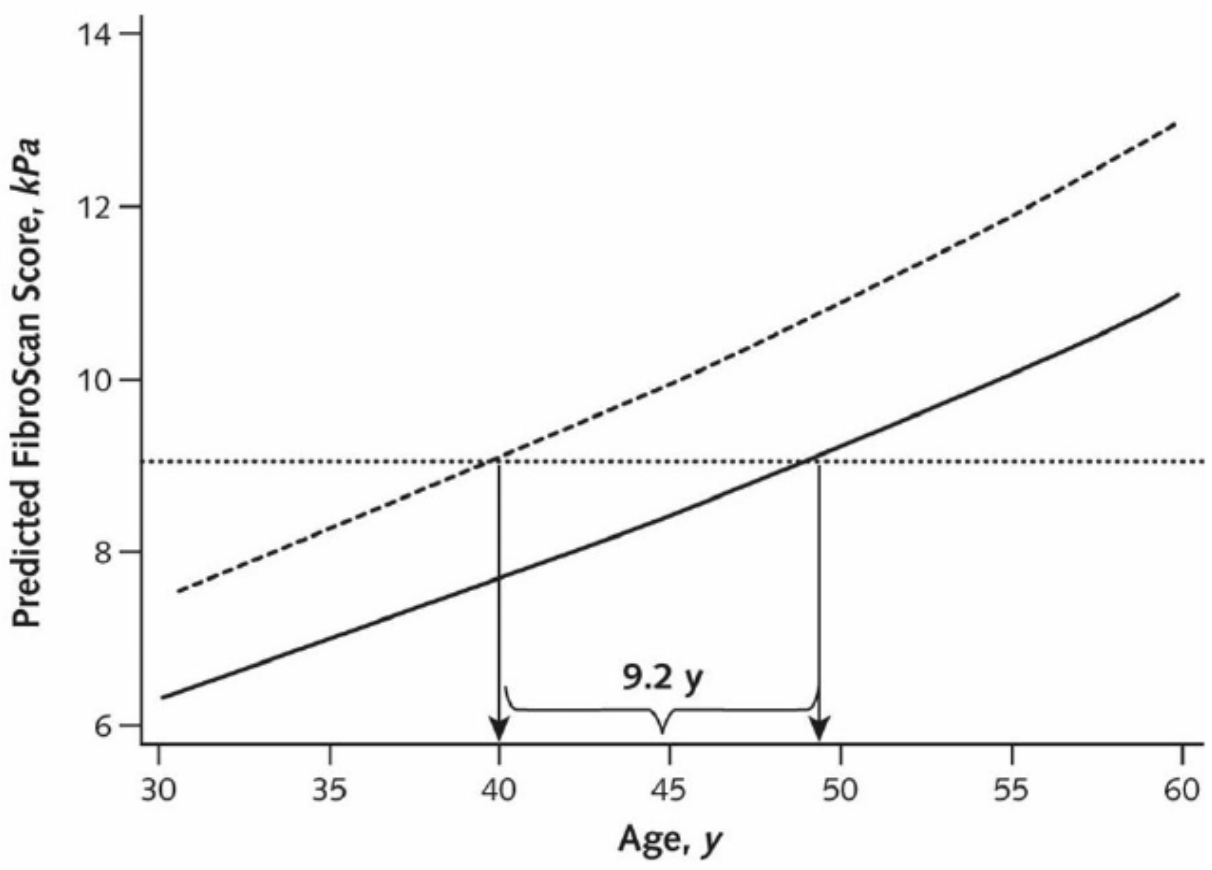

Figure 3. Liver fibrosis and age among persons coinfected with HIV and HCV (dashed line) and those with only HCV (solid line)

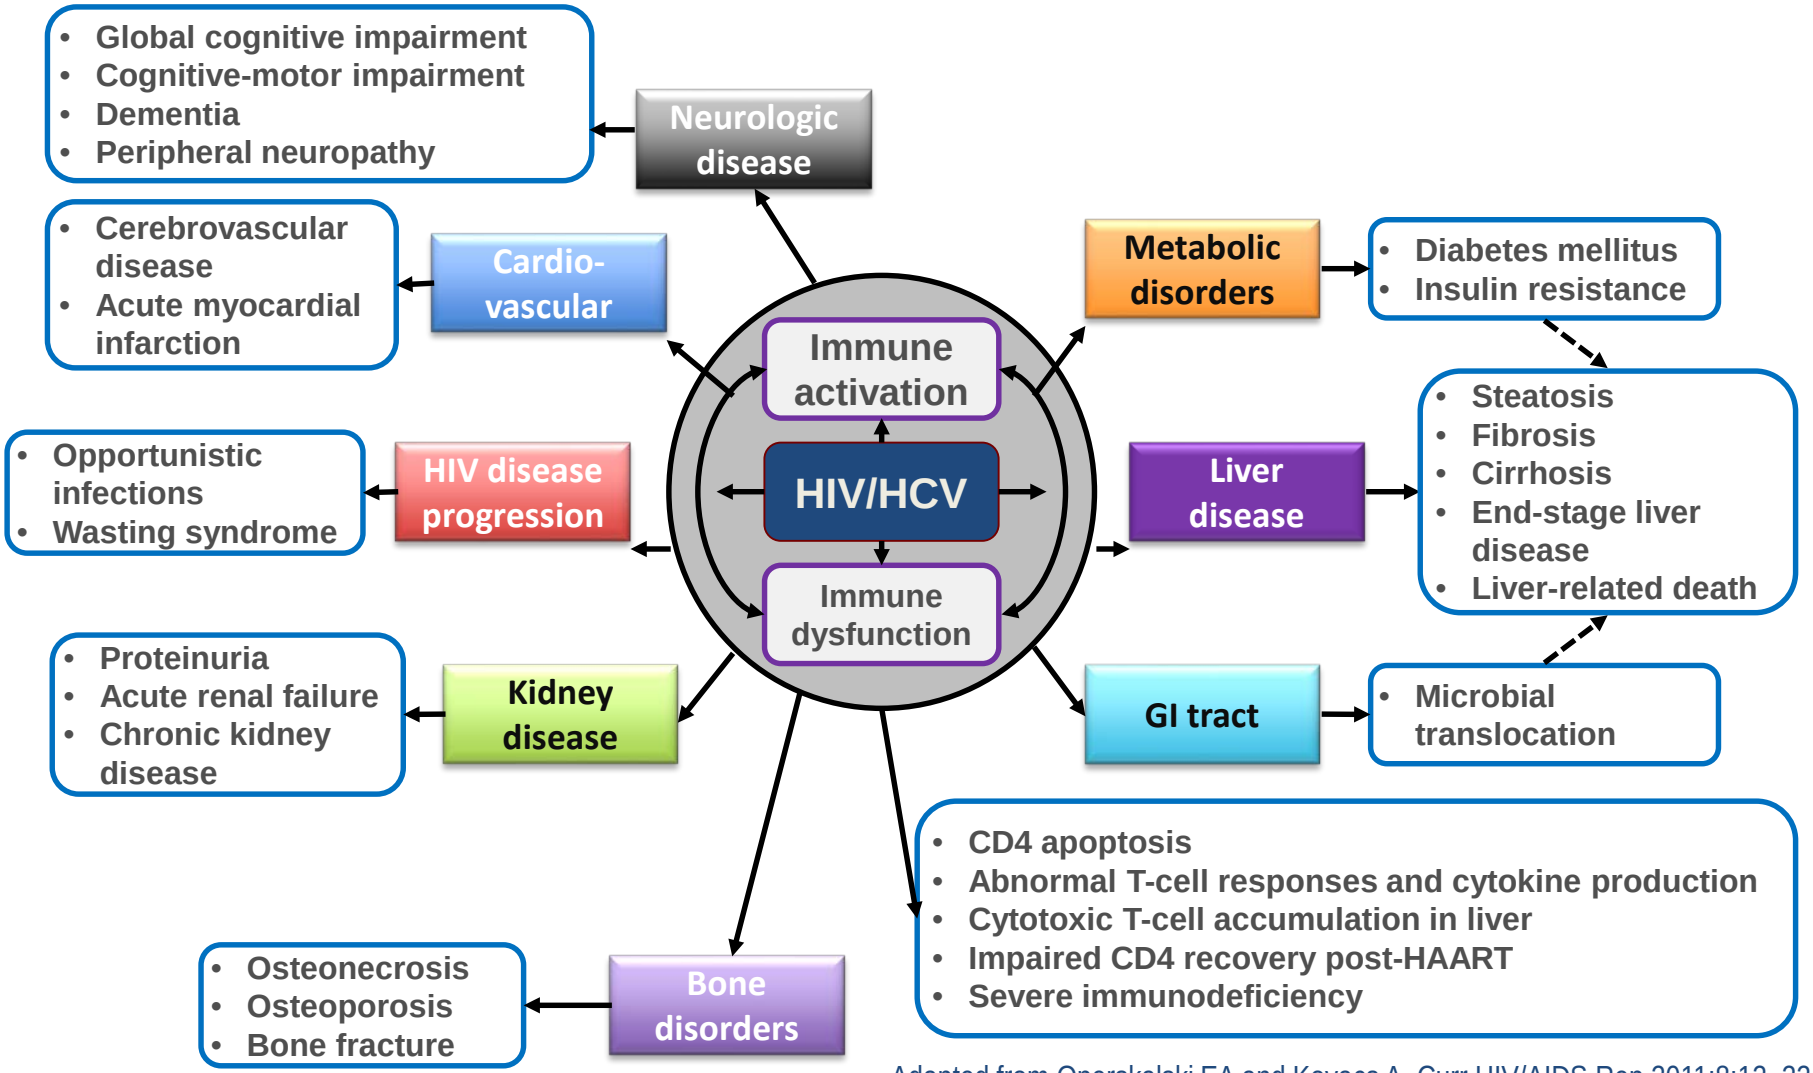
Kirk D, et al. Ann Intern Med 2013; 158: 658

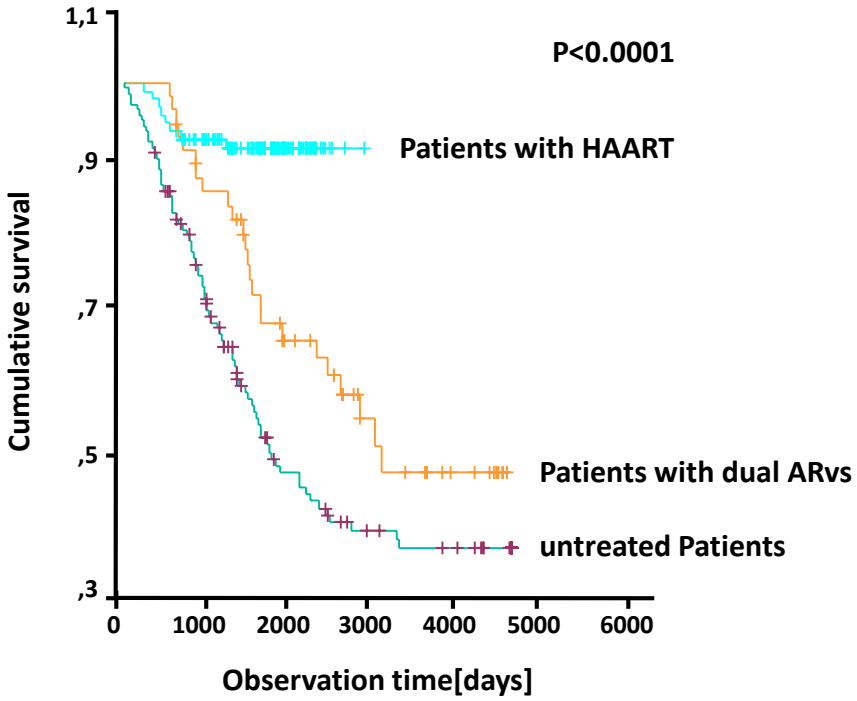
HIV/HCV – a contribution to multiple organ dysfunction



Adapted from Operskalski EA and Kovacs A. Curr HIV/AIDS Rep 2011;8:12–22.

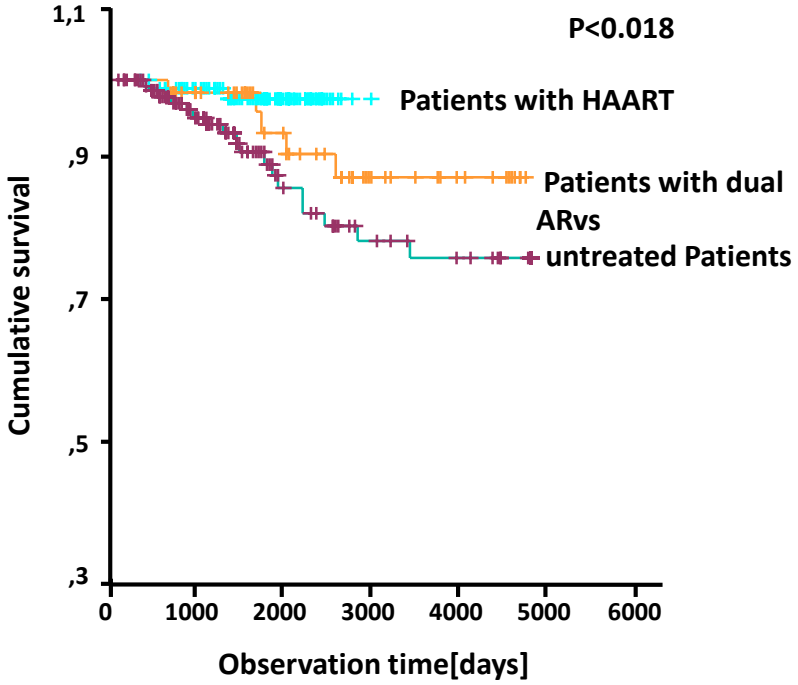
Overall and Liver-related Mortality - effect of HAART

A) Overall-Mortality



Patients under observation:						
HAART-group:	93	79	33	-	-	-
ART-group:	55	46	30	15	9	1
Untreated-group:	13794	49	37	32	27	

B) Liver-related-Mortality

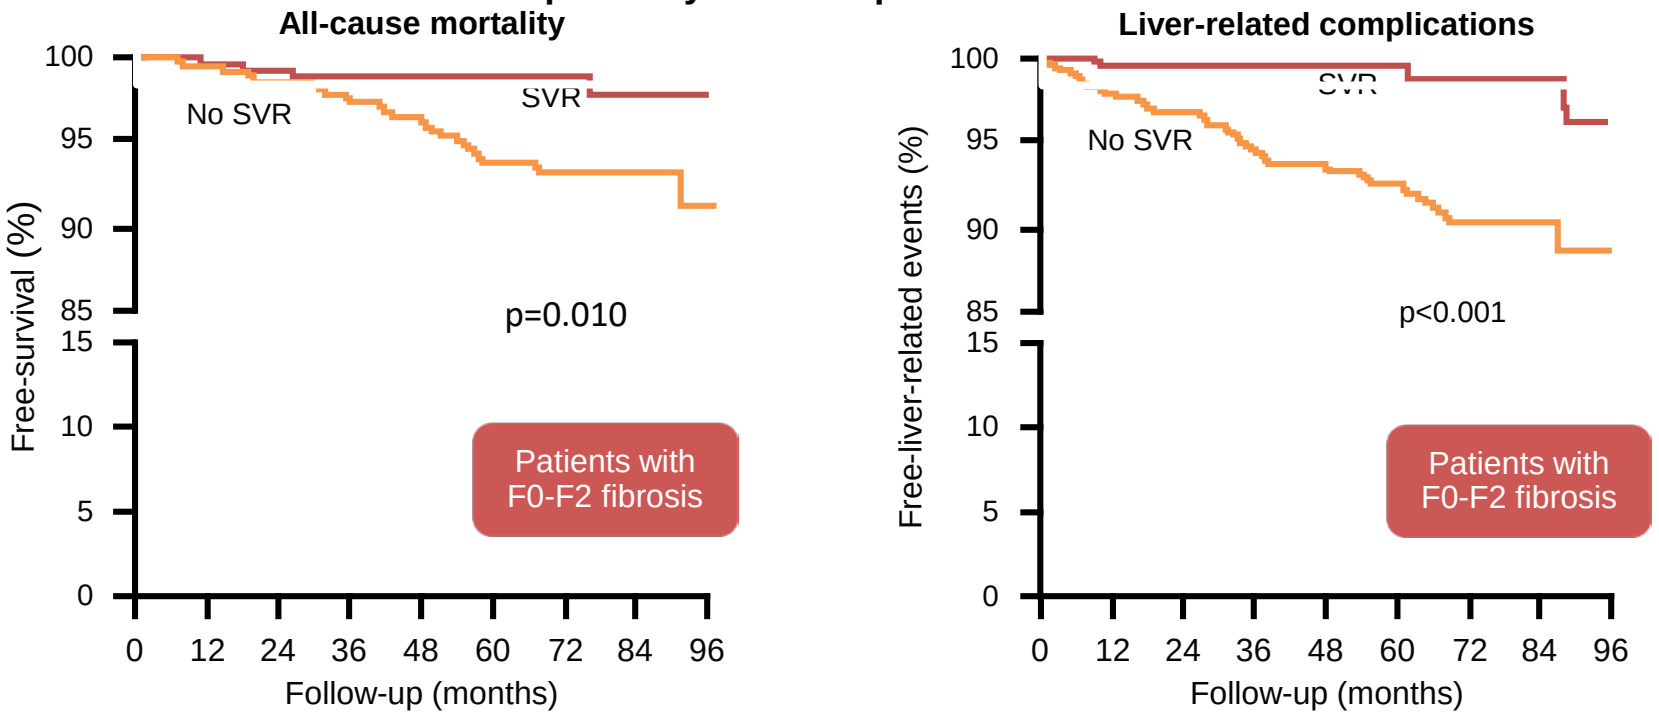


Patients under observation:						
HAART-group:	93	79	33	-	-	-
ART-group:	55	46	30	15	9	1
Untreated-group:	13794	49	37	32	27	

Qurishi N *et al. Lancet*, 2004

SVR in HIV/HCV co-infected patients with mild Fibrosis

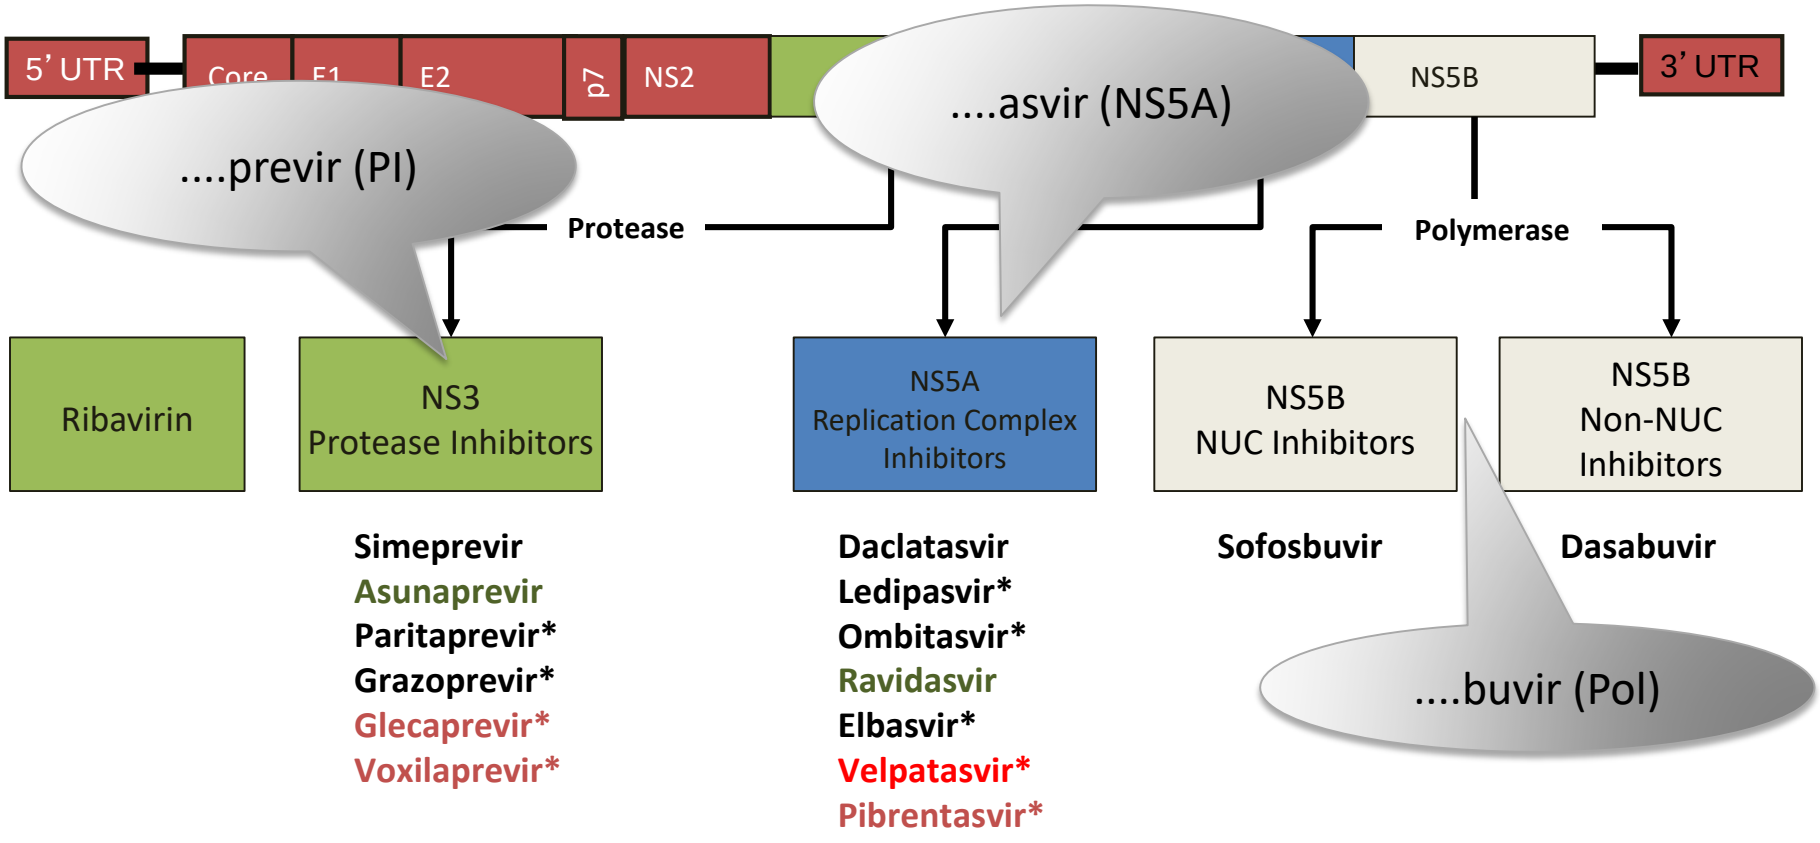
- **A total of 695 HIV/HCV-co-infected patients were treated with IFN/RBV after a median follow-up of 4.9 years. 274 patients achieved an SVR**



The achievement of an SVR after interferon-ribavirin therapy in patients co-infected with HIV/HCV and with mild Fibrosis reduces liver-related complications and mortality

Adapted from Berenguer J et al. J Acquir Immune Defic Syndr 2014;66:280–287

Current DAAs



Not All Direct-Acting Antivirals are Created Equal

Characteristic	Protease Inhibitor*	Protease Inhibitor**	NS5A Inhibitor	Nuc Polymerase Inhibitor	Non-Nuc Polymerase Inhibitor
Resistance profile					
Pangenotypic efficacy					
Antiviral potency					
Adverse events					

 Good profile  Average profile  Least favorable profile

*First generation. **Second generation.

Do HIV+ respond differently to mono-infected patients?

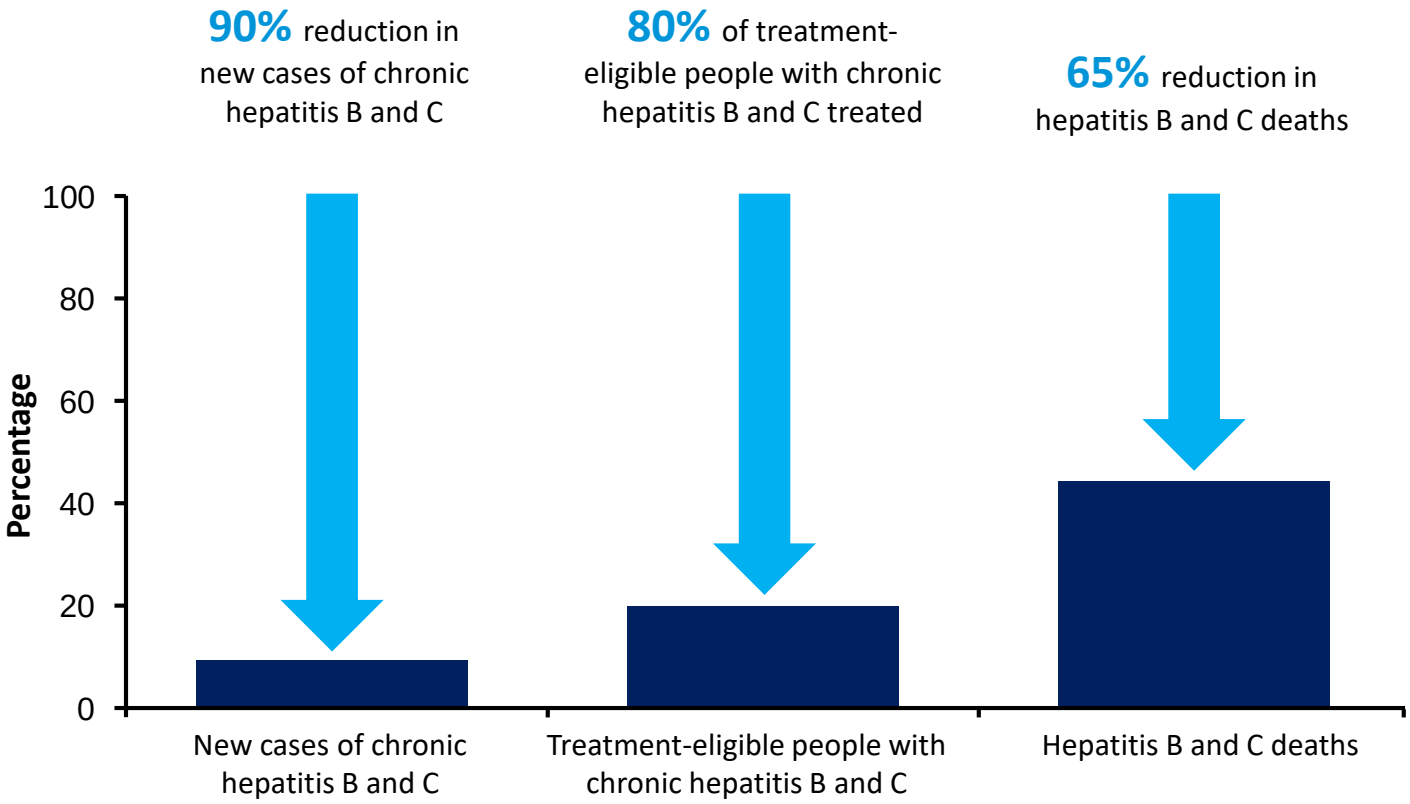
WAR
IS
OVER!
IF YOU WANT IT
Happy Christmas from John & Yoko

Are there remaining 'unresolved' issues with HCV?

- Is 'shorter' therapy possible for co-infected patients with 'acute' HCV?
- Will TasP work?
- Will we be able to 'eliminate' HCV by 2030?
- (Is it ever 'too late' to treat HCV?
  - ESLD – Rx vs. Transplant followed by Rx)

The WHO has set ambitious global targets in order to control viral hepatitis by 2030



World Health Organization

WHO global health sector strategy on viral hepatitis. Available at: http://apps.who.int/iris/bitstream/10665/246177/1/WHO-HIV-2016.06-eng.pdf?ua=1 (accessed June 2017)

Control? Elimination? Eradication? Extinction?

Term	Definition	Continued intervention measures required?
Control	The reduction of disease incidence, prevalence, morbidity or mortality to a locally acceptable level as a result of deliberate efforts	Yes
Elimination	Reduction to zero of the incidence of a specified disease in *a defined geographical area* as a result of deliberate efforts	Yes
Eradication	Permanent reduction to zero of the *worldwide* incidence of infection caused by a specific agent as a result of deliberate efforts	No
Extinction	The specific infectious agent no longer exists in nature or in the laboratory	No

MMWR December 31, 1999;48(SU01):23–7;
Dowdle WR. Vaccine 2011;29:D70–3

Shorter Treatment Durations: Recent Data for Treatment of Acute/early HCV in HIV+ Patients

Study	GT	Number	Regimen	Duration weeks	SVR 12 %
DAHHS[1]	1a	57	BOC + PEG-IFN/RBV	12	86
NYC[2]	1	19	TVR + PEG-IFN/RBV	12	84
DARE-C I[3]	1	14	TVR + PEG-IFN/RBV	8/12/24	71
SWIFT-C[4]	1&4	17	SOF/RBV	12	59
DARE-C II[5]	1&3	14	SOF/RBV	6	21
NYC II[6]	1	12	SOF/RBV	12	92
SLAM-C arm 1[7]	1	15	SOF/LDV	6	100
SLAM-C arm 2[7]	1	15	SOF/SMV	8	100
SOL[8]	1	26	SOF/LDV	6	83
ACTG[9]	1	27	SOF/LDV	8	100
NYCIII[10]	1&4	28	SOF/LDV	8	100
TARGET-3D[11]	1	30	PrOD+RBV	8	100
DAHHS-2[12]	1&4	80	GRZ/ELB	8	98

On-going studies of short(er) duration therapy for early HCV

- TARGET studies
  - Part 2 – 6 weeks G/P (all genotypes) – 30 patients (in press – 95% SVR 12 ITT analysis)
  - Part 3 – 4 weeks G/P (all genotypes)- 30 patients (recruitment phase)

- REACT
  - Global RCT of 6 weeks vs. 12 weeks of Sof/Vel
  - Aiming to recruit 250 patients
  - STOPPED EARLY by DSMB – will report at AASLD

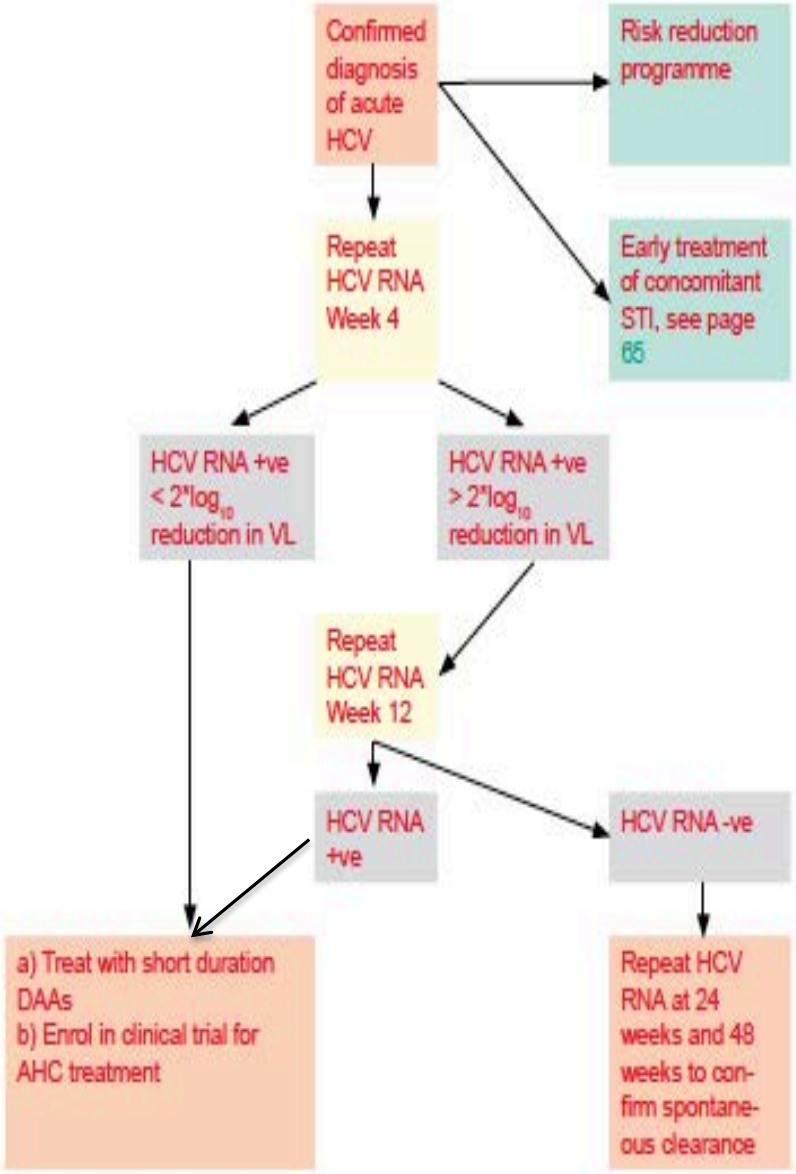
Why the need for short duration of Rx for ‘Acute’ HCV?

- Most DAAs licensed for ‘chronic’ HCV
- Traditional definition of ‘chronic’
  - Six months of viraemia

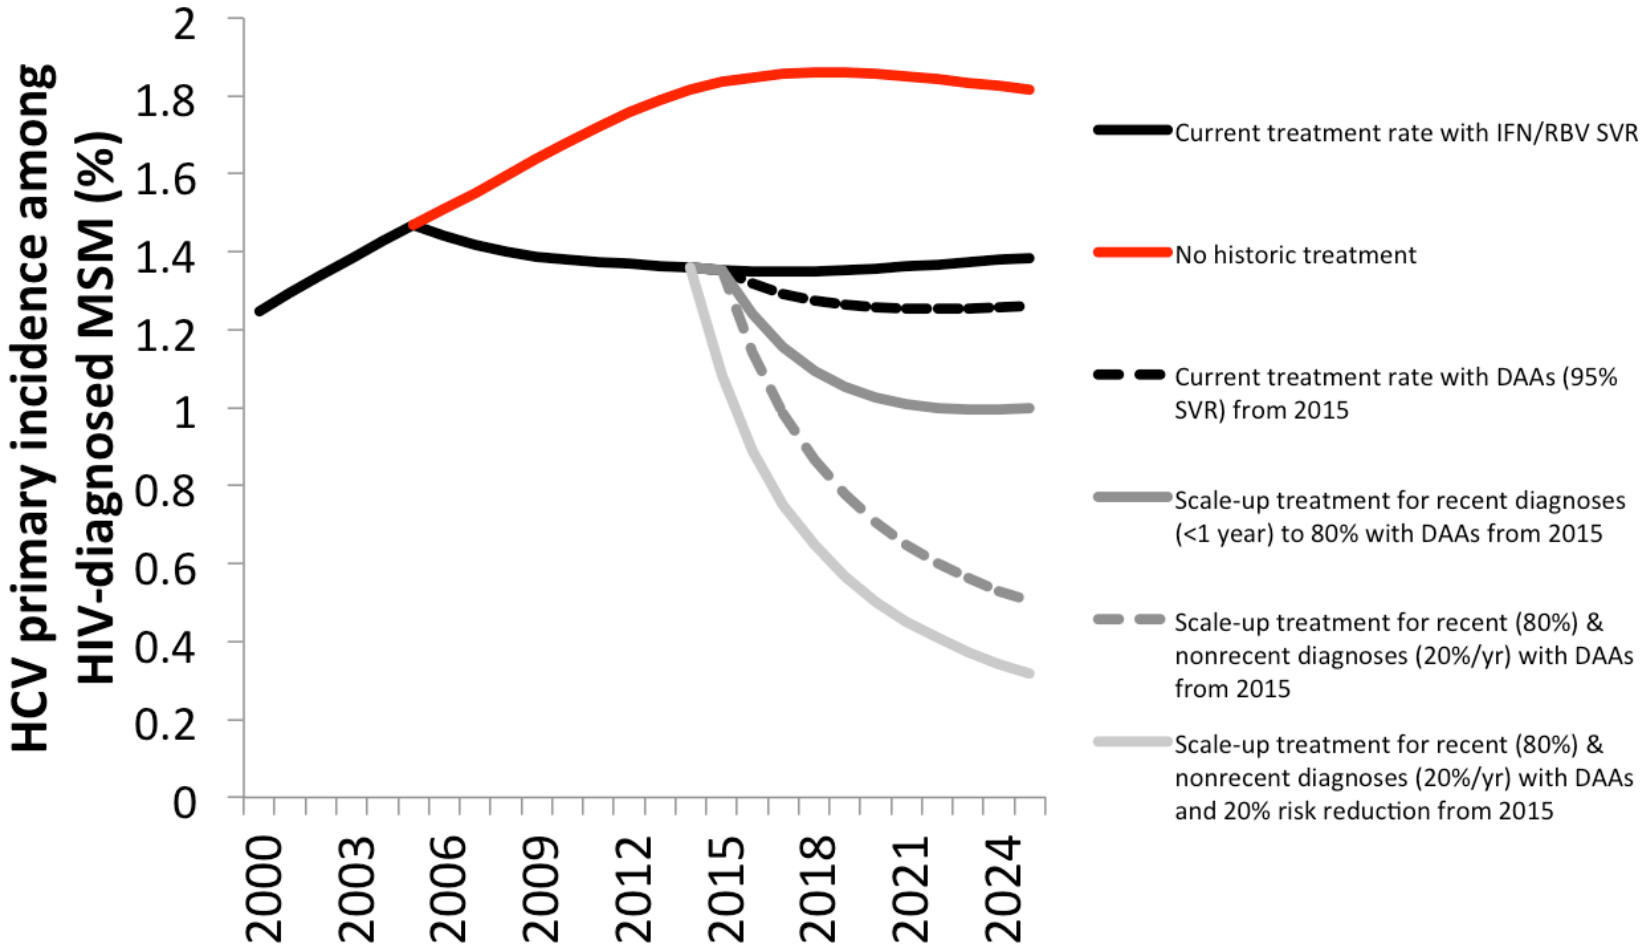
- However, in most cases difficult to define time of exposure/infection
- Failure to clear virus spontaneously = chronic

- New Definitions (NEAT-ID – September 2019)
  - Recently Acquired HCV
  - Demonstration of low likelihood of spontaneous clearance = chronic infection
  - Chronic Infection < 12 months = Early Chronic Infection

Algorithm for Management of Acute HCV in Persons with HCV/HIV Co-infection



Treatment As Prevention in HIV/HCV



N Martin, et al 2015 (manuscript submitted)

Substantial decline in Acute HCV post DAA rollout in the Netherlands

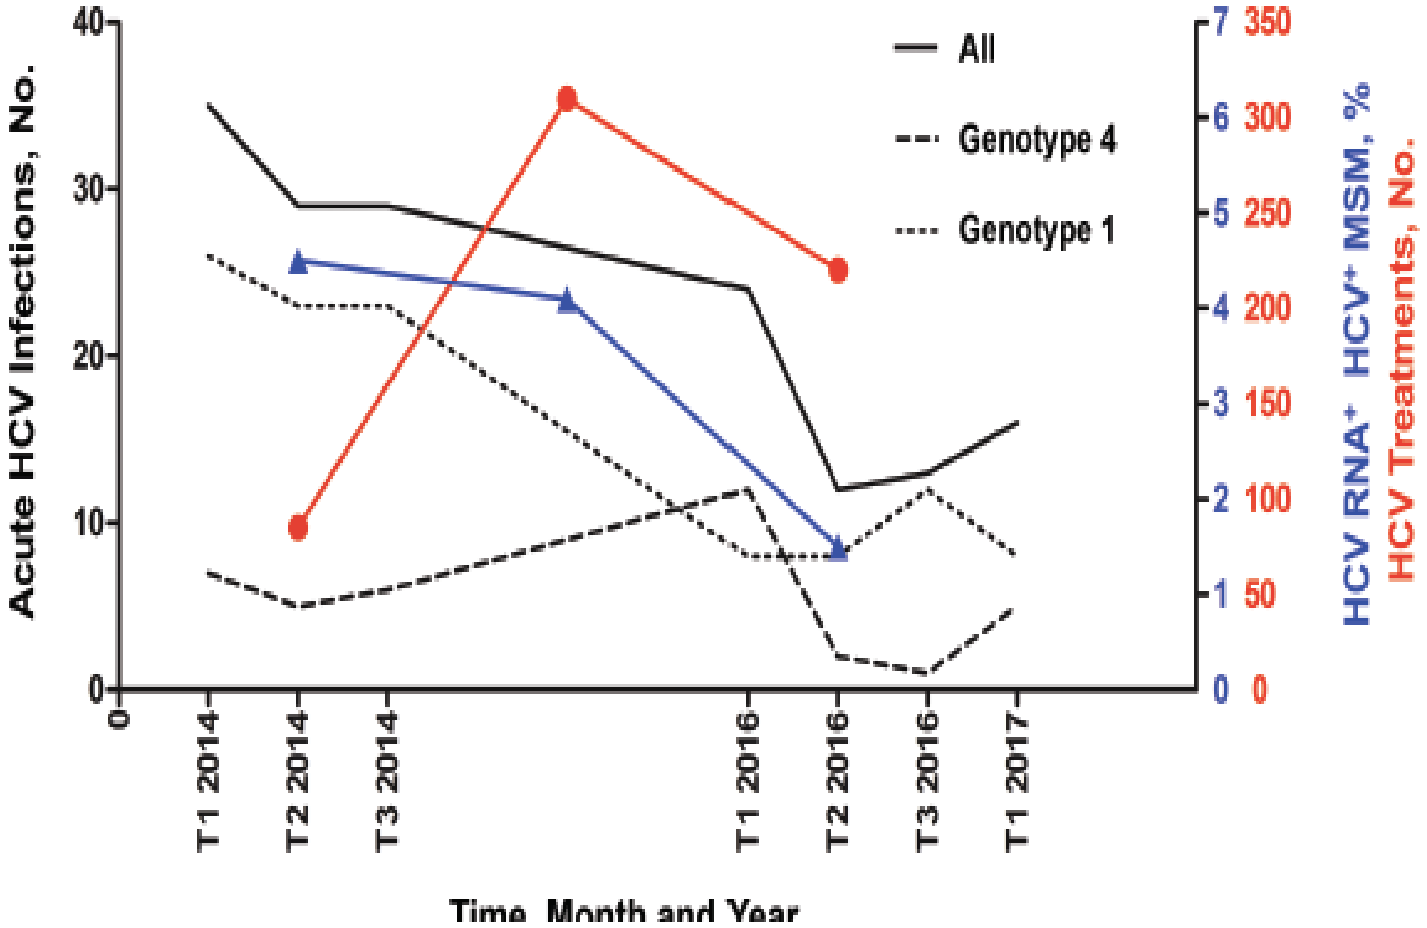
Study hypothesis:

Unrestricted DAA access will result in a decrease in the number of new HCV infections in HIV+MSM

- By 2017, 742/971 (76%) HIV+ MSM patients treated for HCV
  - 50% 2014, 65% 2016, treated Acute HCV in the early phase via clinical trials (DAHHS 1 and 2 studies)

Rjinders, et al24th CROI Seattle, WA Feb 13-1 2017 O137LB

Substantial decline in Acute HCV post DAA rollout in the Netherlands



Boerekamps, et al. CID 2018: 66: 1360

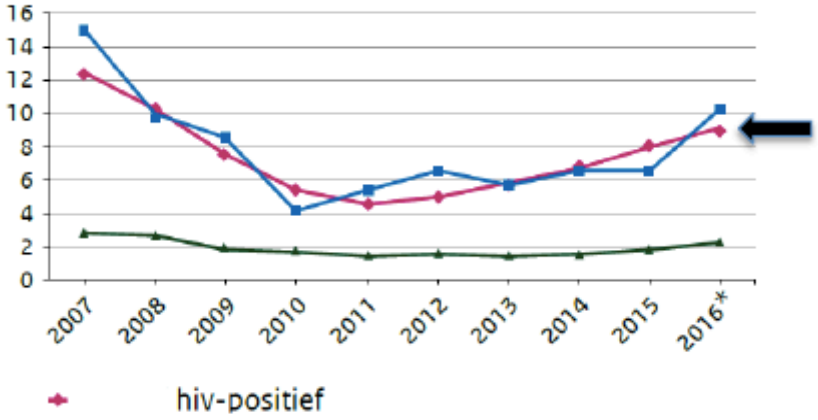
Decline NOT associated with reduction in risk-behaviour

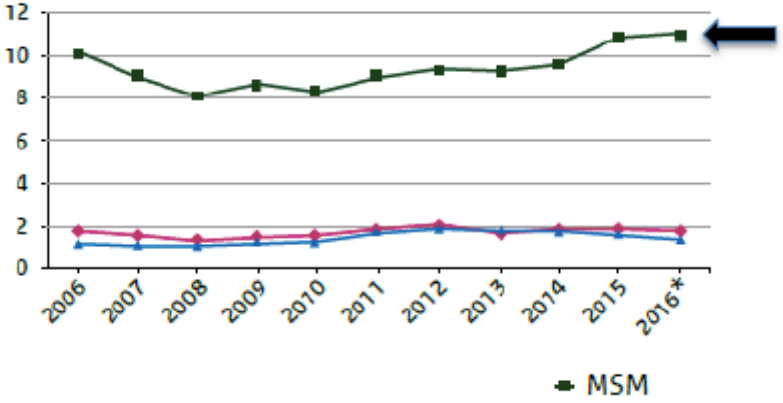
What about syphilis in MSM at public health STD clinics:

First six months of 2015:
N=446 syphilis infections diagnosed

First 6 months of 2016:
N=629 syphilis infections diagnosed (=41% increase ! 95% in MSM)

Syphilis in HIV+MSM

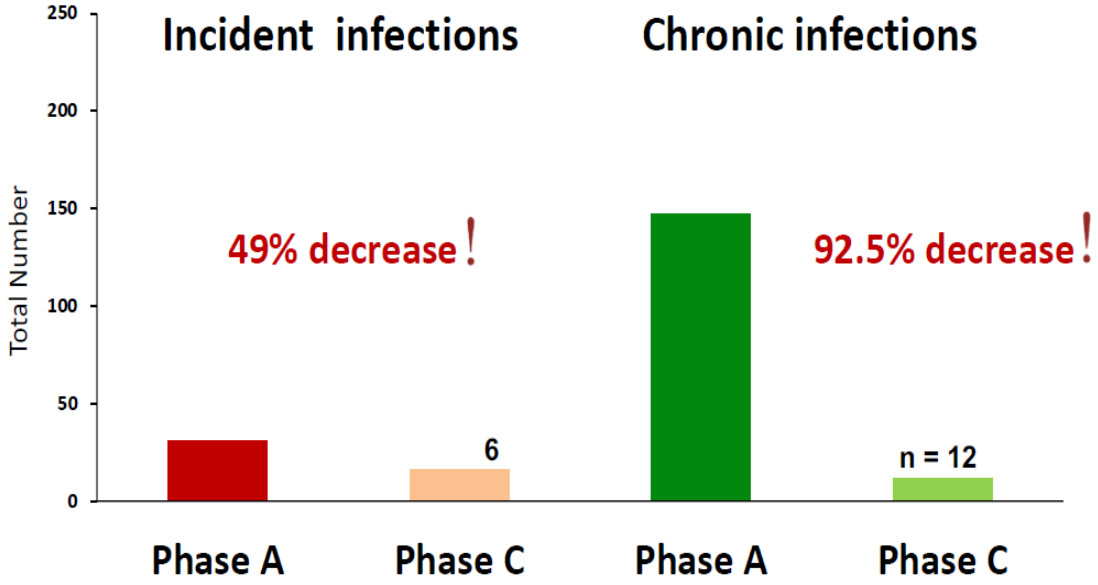




Rjinders, et al24th CROI Seattle, WA Feb 13-1 2017 O137LB

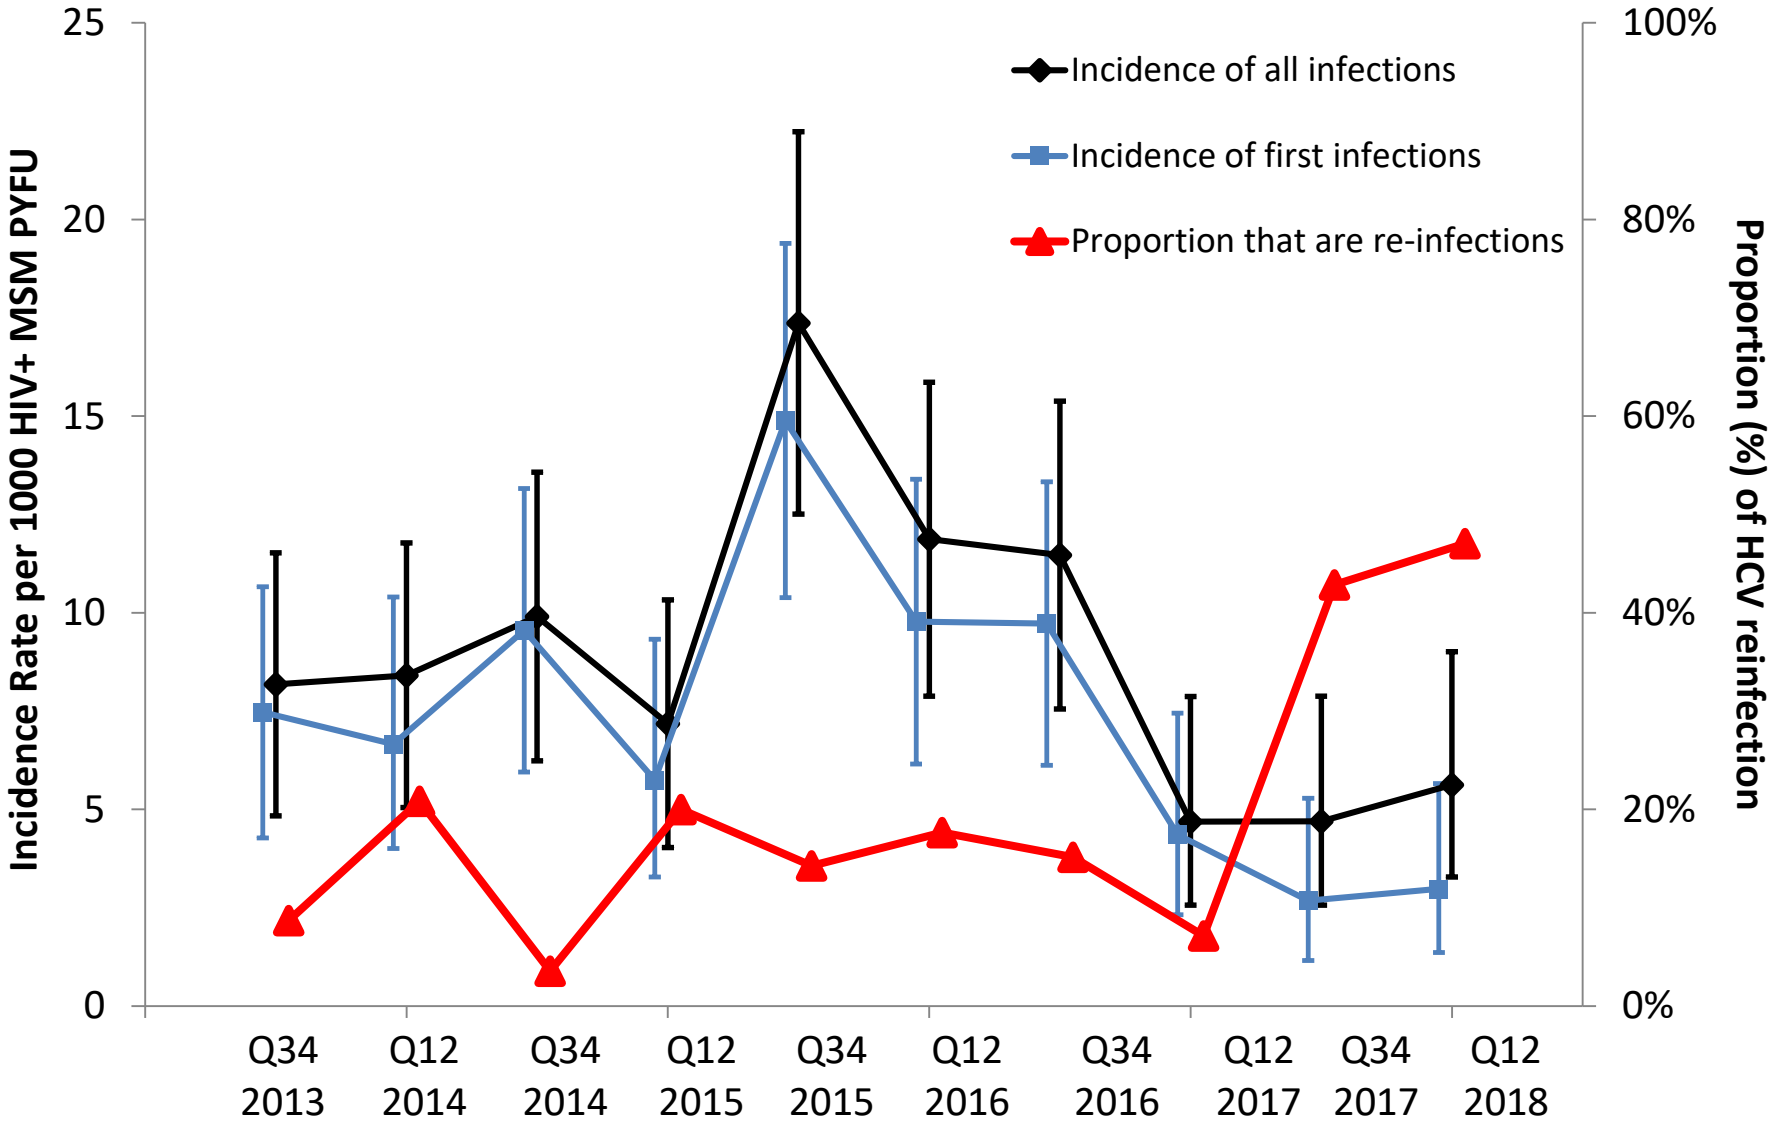
TasP in HCV/HIV+ MSM: HCVREE Study

- Systematic screening of ALL HIV+ MSM with 6-monthly HCV PCR tests in Swiss Cohort (n=3722)
- 177 (4,8%) diagnosed HCV (Phase A) 30 (17%) acute and 147 chronic HCV -> DAA therapy (12 weeks of G/E or local SOC) – 161 (91%) successfully treated
- At re-screening (only) 28 (0,8%) PCR positive (Phase C) – 16 new infections



- Braun L et al 25th CROI; Boston, MA; March 4-7, 2018 Abst. 81LB

London HCV amongst MSM: Incidence and reinfection proportion – pre and post-DAAs



Compelling data that ‘TasP’ works…

- 50%+ reduction in the incidence of acute HCV Infection
- A large effect of ‘early’ Rx

- However, even in the best case scenario, incidence is not down to 0%, and looks like it is plateauing out

Conclusions

- Liver disease remains an important cause of morbidity and mortality in HIV+
- Key issues = cART, HBV, HCV and lifestyle
- HBV – key issues – diagnosis and management
- HCV
  - DAAs for all – generic preparations available
  - Responses in HIV+ similar to HIV-
  - Beware DDIs
- Need for improved cascade of care and access to Rx – 'Micro-elimination' a realistic goal
- NAFLD – increasingly recognised
  - Managing cardiovascular risk is the key issue
  - Small number – progressive liver damage
